

Bezier Curve

Bézier Curves

- Hermite cubic curves are difficult to model
 - need to specify point and gradient.
 - More intuitive to only specify points.
 - Pierre Bézier (an engineer at Renault) specified 2 endpoints and 2 additional control points to specify the gradient at the endpoints.
 - Can be derived from Hermite matrix:
 - Two end control points specify tangent
-

Bézier Curves

Note the Convex Hull has been shown as a dashed line – used as a bounding extent for intersection purposes.

Bézier Matrix

- The cubic form is the most popular
 $X(t) = t^T M_B q$ (M_B is the Bézier matrix)
- With $n=4$ and $r=0,1,2,3$ we get:

$$X(t) = \begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} q_0 \\ q_1 \\ q_2 \\ q_3 \end{bmatrix}$$

- Similarly for $Y(t)$ and $Z(t)$
-

Bézier blending functions

This is how they look –

The functions sum to 1 at any point along the curve.

Endpoints have full weight

The weights of each function is clear and the labels show the control

Joining Bezier Curves

- G^1 continuity is provided at the endpoint when $P_2 - P_3 = k(Q_1 - Q_0)$
- if $k=1$, C^1 continuity is obtained

Bicubic patches

- The concept of parametric curves can be extended to surfaces
 - The cubic parametric curve is in the form of $Q(t) = t^T M \mathbf{q}$ where $\mathbf{q} = (q_1, q_2, q_3, q_4)$: q_i control points, M is the basis matrix (Hermite or Bezier, ...), $t^T = (t^3, t^2, t, 1)$
-

Computer Graphics

- Now we assume q_i to vary along a parameter s ,
- $Q_i(s, t) = \mathbf{t}^T \mathbf{M} [q_1(s), q_2(s), q_3(s), q_4(s)]$
- $q_i(s)$ are themselves cubic curves, we can write them in the form ...

Bicubic patches

$$Q(s, t) = t^T \cdot M \cdot (s^T \cdot M \cdot [\mathbf{q}_{11}, \mathbf{q}_{12}, \mathbf{q}_{13}, \mathbf{q}_{14}], \dots, s^T \cdot M \cdot [\mathbf{q}_{41}, \mathbf{q}_{42}, \mathbf{q}_{43}, \mathbf{q}_{44}])$$

$$= t^T \cdot M \cdot \mathbf{q} \cdot M^T \cdot s$$

$$\begin{bmatrix} q_{11} & q_{21} & q_{31} & q_{41} \\ q_{12} & q_{22} & q_{32} & q_{42} \\ q_{13} & q_{23} & q_{33} & q_{43} \\ q_{14} & q_{24} & q_{34} & q_{44} \end{bmatrix}$$

where \mathbf{q} is a 4x4 matrix

Each column contains the control points of $q_1(s), \dots, q_4(s)$

x, y, z computed by $x(s, t) = t^T \cdot M \cdot \mathbf{q}_x \cdot M^T \cdot s$

$$y(s, t) = t^T \cdot M \cdot \mathbf{q}_y \cdot M^T \cdot s$$

$$z(s, t) = t^T \cdot M \cdot \mathbf{q}_z \cdot M^T \cdot s$$

Bézier example

- We compute (x,y,z) by

$$x(s,t) = t^T \cdot M_B \cdot q_x \cdot M_B^T \cdot s$$

q_x is 4×4 array of x coords

$$y(s,t) = t^T \cdot M_B \cdot q_y \cdot M_B^T \cdot s$$

q_y is 4×4 array of y coords

$$z(s,t) = t^T \cdot M_B \cdot q_z \cdot M_B^T \cdot s$$

q_z is 4×4 array of z coords

Continuity of Bicubic patches.

- Hermite and Bézier patches
 - C_0 continuity by sharing 4 control points between patches.
 - C_1 continuity when both sets of control points either side of the edge are collinear with the edge.

Displaying Bicubic patches.

- Need to compute the normals
 - vector cross product of the 2 tangent vectors.
 - Need to convert the bicubic patches into a polygon mesh
 - tessellation
-

Normal Vectors

$$\begin{aligned}\frac{\partial}{\partial s} Q(s, t) &= \frac{\partial}{\partial s} (t^T \cdot M \cdot q \cdot M^T \cdot s) = t^T \cdot M \cdot q \cdot M^T \cdot \frac{\partial}{\partial s} (s) \\ &= t^T \cdot M \cdot q_x \cdot M^T \cdot [3s^2, 2s, 1, 0]^T\end{aligned}$$

$$\begin{aligned}\frac{\partial}{\partial t} Q(s, t) &= \frac{\partial}{\partial t} (t^T \cdot M \cdot q \cdot M^T \cdot s) = \frac{\partial}{\partial t} (t^T) \cdot M \cdot q \cdot M^T \cdot s \\ &= [3t^2, 2t, 1, 0]^T \cdot M \cdot q \cdot M^T \cdot s\end{aligned}$$

$$\frac{\partial}{\partial s} Q(s, t) \times \frac{\partial}{\partial t} Q(s, t) = (y_s z_t - y_t z_s, z_s x_t - z_t x_s, x_s y_t - x_t y_s)$$

The surface normal is biquintic (two variables, fifth-degree) polynomial and very expensive

Can use finite difference to reduce the computation

Tessellation

- We need to compute the triangles on the surface
 - The simplest way is do uniform tessellation, which samples points uniformly in the parameter space
 - Adaptive tessellation – adapt the size of triangles to the shape of the surface
 - i.e., more triangles where the surface bends more
 - On the other hand, for flat areas we do not need many triangles
-

Adaptive Tessellation

- For every triangle edges, check if each edge is tessellated enough (`curveTessEnough()`)
 - If all edges are tessellated enough, check if the whole triangle is tessellated enough as a whole (`triTessEnough()`)
 - If one or more of the edges or the triangle's interior is not tessellated enough, then further tessellation is needed
-

Adaptive Tessellation

- When an edge is not tessellated enough, a point is created halfway between the edge points' uv-values
- New triangles are created and the tessellator is once again called with the new triangles as input

Four cases of further tessellation

Computer Graphics Adaptive Tessellation

AdaptiveTessellate(p,q,r)

- tessPQ=not curveTessEnough(p,q)
- tessQR=not curveTessEnough(q,r)
- tessRP=not curveTessEnough(r,p)
- If (tessPQ and tessQR and tessRP)
 - AdaptiveTessellate(p,(p+q)/2,(p+r)/2);
 - AdaptiveTessellate(q,(q+r)/2,(q+p)/2);
 - AdaptiveTessellate(r,(r+p)/2,(r+q)/2);
 - AdaptiveTessellate((p+q)/2,(q+r)/2,(r+p)/2);
- else if (tessPQ and tessQR)
 - AdaptiveTessellate(p,(p+q)/2,r);
 - AdaptiveTessellate((p+q)/2,(q+r)/2,r);
 - AdaptiveTessellate((p+q)/2,q,(q+r)/2);
- else if (tessPQ)
 - AdaptiveTessellate(p,(p+q)/2,r);
 - AdaptiveTessellate(q,r,(p+q)/2);
- Else if (not triTessEnough(p,q,r))
 - AdaptiveTessellate((p+q+r)/3,p,q);
 - AdaptiveTessellate((p+q+r)/3,q,r);
 - AdaptiveTessellate((p+q+r)/3,r,p);

end;

curveTessEnough

- Say you are to judge whether **ab** needs tessellation
- You can compute the midpoint **c**, and compute its distance l from **ab**
- Check if $l/\|\mathbf{a}-\mathbf{b}\|$ is under a threshold
- Can do something similar for triTessEnough
 - Sample at the mass center and calculate its distance from the triangle

Other factors to evaluate

- Inside the view frustum
 - Front facing
 - Occupying a large area in screen space
 - Close to the silhouette of the object
 - Illuminated by a significant amount of specular lighting
-
