```

What will be the running time?

A: Depends on queue

binary heap: $O(E \lg V)$

Fibonacci heap: $O(V \lg V + E)$

Single-Source Shortest Path

- Problem: given a weighted directed graph G , find the minimum-weight path from a given source vertex s to another vertex v
 - “Shortest-path” = minimum weight
 - Weight of path is sum of edges
 - E.g., a road map: what is the shortest path from Chapel Hill to Charlottesville?

Shortest Path Properties

- Again, we have *optimal substructure*: the shortest path consists of shortest subpaths:

- Proof: suppose some subpath is not a shortest path
 - There must then exist a shorter subpath
 - Could substitute the shorter subpath for a shorter path
 - But then overall path is not shortest path. Contradiction

Shortest Path Properties

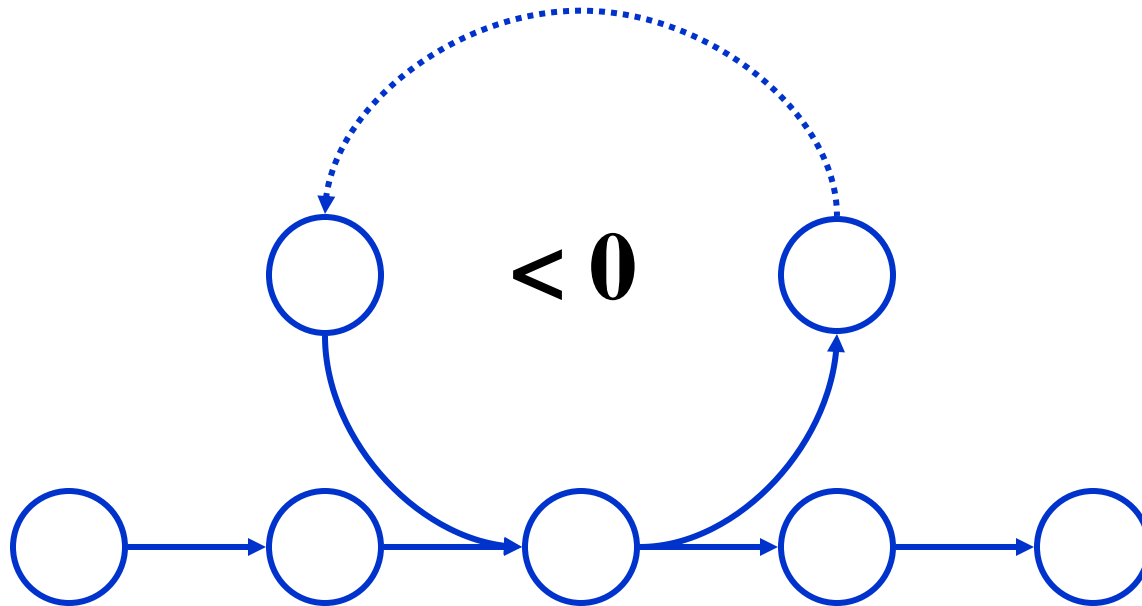

- Define $\delta(u,v)$ to be the weight of the shortest path from u to v
- Shortest paths satisfy the *triangle inequality*:
$$\delta(u,v) \leq \delta(u,x) + \delta(x,v)$$
- “Proof”:

This path is no longer than any other path

Shortest Path Properties

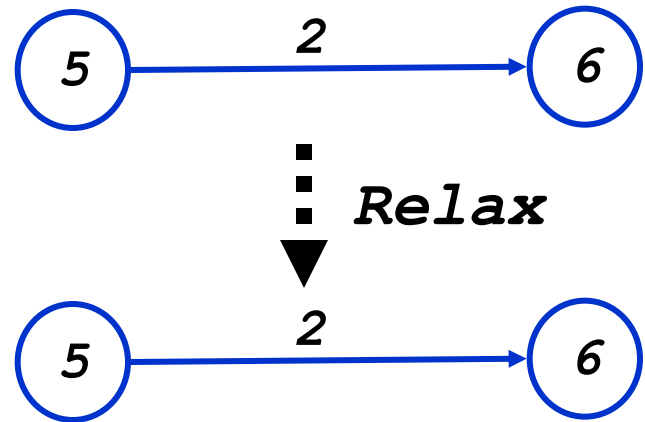

- In graphs with negative weight cycles, some shortest paths will not exist (*Why?*):

Relaxation

- A key technique in shortest path algorithms is *relaxation*
 - Idea: for all v , maintain upper bound $d[v]$ on $\delta(s,v)$

```
Relax (u, v, w) {  
    if (d[v] > d[u] + w) then d[v] = d[u] + w;  
}
```

Bellman-Ford Algorithm

```
BellmanFord()
```

```
  for each  $v \in V$ 
```

```
     $d[v] = \infty$ ;
```

```
 $d[s] = 0$ ;
```

```
  for  $i=1$  to  $|V|-1$ 
```

```
    for each edge  $(u,v) \in E$ 
```

```
      Relax( $u,v, w(u,v)$ );
```

```
  for each edge  $(u,v) \in E$ 
```

```
    if ( $d[v] > d[u] + w(u,v)$ )
```

```
      return "no solution";
```

Initialize $d[]$, which will converge to shortest-path value δ

*Relaxation:
Make $|V|-1$ passes, relaxing each edge*

*Test for solution
Under what condition do we get a solution?*

```
Relax( $u,v,w$ ): if ( $d[v] > d[u]+w$ ) then  $d[v]=d[u]+w$ 
```

Bellman-Ford Algorithm

```
BellmanFord()  
  for each  $v \in V$   
     $d[v] = \infty$ ;  
 $d[s] = 0$ ;  
  for  $i=1$  to  $|V|-1$   
    for each edge  $(u,v) \in E$   
      Relax( $u,v, w(u,v)$ );  
  for each edge  $(u,v) \in E$   
    if ( $d[v] > d[u] + w(u,v)$ )  
      return "no solution";
```

*What will be the
running time?*

Relax(u,v,w): if ($d[v] > d[u]+w$) then $d[v]=d[u]+w$

Bellman-Ford Algorithm

```
BellmanFord()  
  for each  $v \in V$   
     $d[v] = \infty$ ;  
 $d[s] = 0$ ;  
  for  $i=1$  to  $|V|-1$   
    for each edge  $(u,v) \in E$   
      Relax( $u,v, w(u,v)$ );  
  for each edge  $(u,v) \in E$   
    if ( $d[v] > d[u] + w(u,v)$ )  
      return "no solution";
```

*What will be the
running time?*

A: $O(VE)$

Relax(u,v,w): if ($d[v] > d[u]+w$) then $d[v]=d[u]+w$

Bellman-Ford Algorithm

```
BellmanFord()  
  for each  $v \in V$   
     $d[v] = \infty$ ;  
 $d[s] = 0$ ;  
  for  $i=1$  to  $|V|-1$   
    for each edge  $(u,v) \in E$   
      Relax( $u,v, w(u,v)$ );  
  for each edge  $(u,v) \in E$   
    if ( $d[v] > d[u] + w(u,v)$ )  
      return "no solution";
```

Ex: work on board

Relax(u,v,w): if ($d[v] > d[u]+w$) then $d[v]=d[u]+w$

Bellman-Ford

- Note that order in which edges are processed affects how quickly it converges
- Correctness: show $d[v] = \delta(s,v)$ after $|V|-1$ passes
 - Lemma: $d[v] \geq \delta(s,v)$ always
 - Initially true
 - Let v be first vertex for which $d[v] < \delta(s,v)$
 - Let u be the vertex that caused $d[v]$ to change:
 $d[v] = d[u] + w(u,v)$
 - Then $d[v] < \delta(s,v)$
 $\delta(s,v) \leq \delta(s,u) + w(u,v)$ (*Why?*)
 $\delta(s,u) + w(u,v) \leq d[u] + w(u,v)$ (*Why?*)
 - So $d[v] < d[u] + w(u,v)$. Contradiction.

Bellman-Ford

- Prove: after $|V|-1$ passes, all d values correct
 - Consider shortest path from s to v :
 $s \rightarrow v_1 \rightarrow v_2 \rightarrow v_3 \rightarrow v_4 \rightarrow v$
 - Initially, $d[s] = 0$ is correct, and doesn't change (*Why?*)
 - After 1 pass through edges, $d[v_1]$ is correct (*Why?*) and doesn't change
 - After 2 passes, $d[v_2]$ is correct and doesn't change
 - ...
 - Terminates in $|V| - 1$ passes: (*Why?*)
 - *What if it doesn't?*

DAG Shortest Paths

- Problem: finding shortest paths in DAG
 - Bellman-Ford takes $O(VE)$ time.
 - *How can we do better?*
 - Idea: use topological sort
 - If we were lucky and processed vertices on each shortest path from left to right, would be done in one pass
 - Every path in a dag is subsequence of topologically sorted vertex order, so processing verts in that order, we will do each path in forward order (will never relax edges out of vert before doing all edges into vert).
 - Thus: just one pass. *What will be the running time?*

Dijkstra's Algorithm

- If no negative edge weights, we can beat BF
- Similar to breadth-first search
 - Grow a tree gradually, advancing from vertices taken from a queue
- Also similar to Prim's algorithm for MST
 - Use a priority queue keyed on $d[v]$

Dijkstra's Algorithm

Dijkstra(G)

for each $v \in V$

$d[v] = \infty$;

$d[s] = 0$; $S = \emptyset$; $Q = V$;

while ($Q \neq \emptyset$)

$u = \text{ExtractMin}(Q)$;

$S = S \cup \{u\}$;

for each $v \in u \rightarrow \text{Adj}[]$

if ($d[v] > d[u] + w(u, v)$)

$d[v] = d[u] + w(u, v)$;

Note: this is really a call to $Q \rightarrow \text{DecreaseKey}()$

Ex: run the algorithm

Relaxation Step

Dijkstra's Algorithm

Dijkstra(G)

for each $v \in V$

$d[v] = \infty$;

$d[s] = 0$; $S = \emptyset$; $Q = V$;

while ($Q \neq \emptyset$)

$u = \text{ExtractMin}(Q)$;

$S = S \cup \{u\}$;

 for each $v \in u \rightarrow \text{Adj}[]$

 if ($d[v] > d[u] + w(u, v)$)

$d[v] = d[u] + w(u, v)$;

*How many times is
ExtractMin() called?*

*How many times is
DecreaseKey() called?*

What will be the total running time?

Dijkstra's Algorithm

Dijkstra(G)

for each $v \in V$

$d[v] = \infty$;

$d[s] = 0$; $S = \emptyset$; $Q = V$;

while ($Q \neq \emptyset$)

$u = \text{ExtractMin}(Q)$;

$S = S \cup \{u\}$;

for each $v \in u \rightarrow \text{Adj}[]$

if ($d[v] > d[u] + w(u, v)$)

$d[v] = d[u] + w(u, v)$;

*How many times is
ExtractMin() called?*

*How many times is
DecreaseKey() called?*

A: $O(E \lg V)$ using binary heap for Q

Can achieve $O(V \lg V + E)$ with Fibonacci heaps

Dijkstra's Algorithm

Dijkstra(G)

 for each $v \in V$

$d[v] = \infty$;

$d[s] = 0$; $S = \emptyset$; $Q = V$;

while ($Q \neq \emptyset$)

$u = \text{ExtractMin}(Q)$;

$S = S \cup \{u\}$;

 for each $v \in u \rightarrow \text{Adj}[]$

 if ($d[v] > d[u] + w(u, v)$)

$d[v] = d[u] + w(u, v)$;

Correctness: we must show that when u is removed from Q , it has already converged

Correctness Of Dijkstra's Algorithm

- Note that $d[v] \geq \delta(s,v) \forall v$
- Let u be first vertex picked s.t. \exists shorter path than $d[u]$ $\Rightarrow d[u] > \delta(s,u)$
- Let y be first vertex $\in V-S$ on actual shortest path from $s \rightarrow u$ $\Rightarrow d[y] = \delta(s,y)$
 - Because $d[x]$ is set correctly for y 's predecessor $x \in S$ on the shortest path, and
 - When we put x into S , we relaxed (x,y) , giving $d[y]$ the correct value

Correctness Of Dijkstra's Algorithm

- Note that $d[v] \geq \delta(s,v) \quad \forall v$
- Let u be first vertex picked s.t. \exists shorter path than $d[u]$ $\Rightarrow d[u] > \delta(s,u)$
- Let y be first vertex $\in V-S$ on actual shortest path from $s \rightarrow u$ $\Rightarrow d[y] = \delta(s,y)$
- $d[u] > \delta(s,u)$
 $= \delta(s,y) + \delta(y,u)$ (*Why?*)
 $= d[y] + \delta(y,u)$
 $\geq d[y]$ But if $d[u] > d[y]$, wouldn't have chosen u . Contradiction.

Disjoint-Set Union Problem

- Want a data structure to support disjoint sets
 - Collection of disjoint sets $S = \{S_i\}$, $S_i \cap S_j = \emptyset$
- Need to support following operations:
 - **MakeSet(x):** $S = S \cup \{\{x\}\}$
 - **Union(S_i, S_j):** $S = S - \{S_i, S_j\} \cup \{S_i \cup S_j\}$
 - **FindSet(X):** return $S_i \in S$ such that $x \in S_i$
- Before discussing implementation details, we look at example application: MSTs

Kruskal's Algorithm

```
Kruskal ()
{
    T =  $\emptyset$ ;
    for each v  $\in$  V
        MakeSet (v) ;
    sort E by increasing edge weight w
    for each (u,v)  $\in$  E (in sorted order)
        if FindSet (u)  $\neq$  FindSet (v)
            T = T  $\cup$  {{u,v}};
            Union (FindSet (u) , FindSet (v)) ;
}
```

Kruskal's Algorithm

```
Kruskal ()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet (v) ;
```

```
  sort E by increasing edge weight w
```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet (u)  $\neq$  FindSet (v)
```

```
      T = T  $\cup$  {(u,v)} ;
```

```
      Union (FindSet (u) , FindSet (v)) ;
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal ()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet (v);
```

```
  sort E by increasing edge weight w
```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet (u)  $\neq$  FindSet (v)
```

```
      T = T  $\cup$  {(u,v)};
```

```
      Union (FindSet (u), FindSet (v));
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet(v);
```

```
  { sort E by increasing edge weight w
```

```
    for each (u,v)  $\in$  E (in sorted order)
```

```
      if FindSet(u)  $\neq$  FindSet(v)
```

```
        T = T  $\cup$  {(u,v)};
```

```
        Union(FindSet(u), FindSet(v));
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet(v);
```

```
  sort E by increasing edge weight w
```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet(u)  $\neq$  FindSet(v)
```

```
      T = T  $\cup$  {(u,v)};
```

```
      Union(FindSet(u), FindSet(v));
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal ()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet (v) ;
```

```
  sort E by increasing edge weight w
```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet(u)  $\neq$  FindSet(v)
```

```
      T = T  $\cup$  {(u,v)} ;
```

```
      Union (FindSet (u) , FindSet (v)) ;
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each  $v \in V$ 
```

```
    MakeSet( $v$ );
```

```
  sort E by increasing edge weight w
```

```
  for each  $(u, v) \in E$  (in sorted order)
```

```
    if FindSet( $u$ )  $\neq$  FindSet( $v$ )
```

```
      T = T  $\cup$   $\{(u, v)\}$ ;
```

```
      Union(FindSet( $u$ ), FindSet( $v$ ));
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal ()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet (v) ;
```

```
  sort E by increasing edge weight w
```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet(u)  $\neq$  FindSet(v)
```

```
      T = T  $\cup$  {(u,v)} ;
```

```
      Union (FindSet (u) , FindSet (v)) ;
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal ()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet (v) ;
```

```
  sort E by increasing edge weight w
```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet(u)  $\neq$  FindSet(v)
```

```
      T = T  $\cup$  {{u,v}};
```

```
      Union(FindSet(u) , FindSet(v)) ;
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal ()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each v  $\in$  V
```

```
    MakeSet (v) ;
```

```

```

```
  for each (u,v)  $\in$  E (in sorted order)
```

```
    if FindSet (u)  $\neq$  FindSet (v)
```

```
      T = T  $\cup$  {(u,v)} ;
```

```
      Union (FindSet (u) , FindSet (v)) ;
```

```
}
```

Run the algorithm:

Correctness Of Kruskal's Algorithm

- Sketch of a proof that this algorithm produces an MST for T :
 - Assume algorithm is wrong: result is not an MST
 - Then algorithm adds a wrong edge at some point
 - If it adds a wrong edge, there must be a lower weight edge (cut and paste argument)
 - But algorithm chooses lowest weight edge at each step. Contradiction
- Again, important to be comfortable with cut and paste arguments

Kruskal's Algorithm

```
Kruskal ()
```

What will affect the running time?

```
{
```

```
    T =  $\emptyset$ ;
```

```
    for each v  $\in$  V
```

```
        MakeSet(v);
```

```
    sort E by increasing edge weight w
```

```

```
}
```

What will affect the running time?

1 Sort

O(V) MakeSet() calls

O(E) FindSet() calls

O(V) Union() calls

(Exactly how many Union()s?)

Kruskal's Algorithm: Running Time

- To summarize:
 - Sort edges: $O(E \lg E)$
 - $O(V)$ MakeSet()'s
 - $O(E)$ FindSet()'s
 - $O(V)$ Union()'s
- Upshot:
 - Best disjoint-set union algorithm makes above 3 operations take $O(E \cdot \alpha(E, V))$, α almost constant
 - Overall thus $O(E \lg E)$, almost linear w/o sorting

Disjoint Set Union

- So how do we implement disjoint-set union?
 - Naïve implementation: use a linked list to represent each set:

- MakeSet(): ??? time
- FindSet(): ??? time
- Union(A,B): “copy” elements of A into B: ??? time

Disjoint Set Union

- So how do we implement disjoint-set union?

- Naïve implementation: use a linked list to represent each set:

- MakeSet(): $O(1)$ time
- FindSet(): $O(1)$ time
- Union(A,B): “copy” elements of A into B: $O(A)$ time
- *How long can a single Union() take?*
- *How long will n Union()’s take?*

Disjoint Set Union: Analysis

- Worst-case analysis: $O(n^2)$ time for n Union's

Union(S_1, S_2)	“copy”	1 element
Union(S_2, S_3)	“copy”	2 elements
...		
<u>Union(S_{n-1}, S_n)</u>	<u>“copy”</u>	<u>n-1 elements</u>
		$O(n^2)$

- Improvement: always copy smaller into larger
 - *Why will this make things better?*
 - *What is the worst-case time of Union()?*
- But now n Union's take only $O(n \lg n)$ time!

Amortized Analysis of Disjoint Sets

- *Amortized analysis* computes average times without using probability
- With our new Union(), any individual element is copied at most $\lg n$ times when forming the complete set from 1-element sets
 - Worst case: Each time copied, element in smaller set

1st time	resulting set size	≥ 2
2nd time		≥ 4
...		
($\lg n$)th time		$\geq n$

Amortized Analysis of Disjoint Sets

- Since we have n elements each copied at most $\lg n$ times, n `Union()`'s takes $O(n \lg n)$ time
- We say that each `Union()` takes $O(\lg n)$ *amortized time*
 - Financial term: imagine paying $\$(\lg n)$ per `Union`
 - At first we are overpaying; initial `Union` $\$O(1)$
 - But we accumulate enough $\$$ in bank to pay for later expensive $O(n)$ operation.
 - Important: amount in bank never goes negative
