

# Total Derivative

# Graphing the Derivative

- When graphing the derivative, you are graphing the slope of the original function.

# Graphing the Derivative

- When  $x < -2$ , the slope is 1
- When  $-2 < x < 0$ , the slope is -1
- At  $x = -2$  and  $x = 0$  the derivative does not exist—why?

# Graphing the Derivative

- For  $x > 0$ , the derivative is positive—estimated to be a slope of 1 at  $x = 1$
- As  $x$  approaches 0 from the right, the derivative becomes larger
- As  $x$  approaches infinity, the derivative approaches 0.

# Graphing

- Which is the  $f(x)$  and which is  $f'(x)$ ?
- The derivative is 0 (crosses the x-axis) wherever there is a horizontal tangent
- $Y1 = f(x)$
- $Y2 = f'(x)$

# Calculating the Derivative

## Notation

### NOTATIONS FOR THE DERIVATIVE

The derivative of  $y = f(x)$  may be written in any of the following ways:

$$f'(x), \quad \frac{dy}{dx}, \quad \frac{d}{dx}[f(x)], \quad \text{or} \quad D_x[f(x)].$$

# Constant Rule

## CONSTANT RULE

If  $f(x) = k$ , where  $k$  is any real number, then

$$f'(x) = 0.$$

(The derivative of a constant is 0.)

If  $f(x) = 4$ , then  $f'(x) = 0$

If  $f(x) = \pi$ , then  $f'(x) = 0$

# Power Rule

## POWER RULE

If  $f(x) = x^n$  for any real number  $n$ , then

$$f'(x) = nx^{n-1}.$$

(The derivative of  $f(x) = x^n$  is found by multiplying by the exponent  $n$  and decreasing the exponent on  $x$  by 1.)

# Power Rule – Examples

- If  $f(x) = x^6$ , find  $D_x y$

- $D_x y = 6x^{6-1} = 6x^5$

- If  $f(x) = x$ , find  $\frac{dy}{dx}$

$$\frac{dy}{dx} = 1x^0 = 1$$

$\frac{1}{x^3}$  must be rewritten

$$x^{-3}$$

- If  $y = \frac{1}{x^3}$  find  $\frac{dy}{dx}$

$$\frac{dy}{dx} = -3x^{-4} = \frac{-3}{x^4}$$

# Power Rule Examples

- **Example 1:** Given  $f(x) = 3x^2$ , find  $f'(x)$ .
- $f'(x) = 6x$
- **Example 2:** Find the first derivative given  $f(x) = 8x$ .
- $8x^0 = 8$

# Sum or Difference Rule

## SUM OR DIFFERENCE RULE

If  $f(x) = u(x) \pm v(x)$ , and if  $u'(x)$  and  $v'(x)$  exist, then

$$f'(x) = u'(x) \pm v'(x).$$

(The derivative of a sum or difference of functions is the sum or difference of the derivatives.)

# Sum/Difference Examples

- The Sum/Difference rule can be used on each term in a polynomial to find the first derivative.
- Find  $f'(x)$ , given  $f(x) = 5x^4 - 2x^3 - 5x^2 + 8x + 11$
- $f'(x) = 20x^3 - 6x^2 - 10x + 8$
- The derivative of a constant is 0 because 11 is the same as  $11x^0$ , which is  $(0)11x^{-1}$

# Sum/Difference Examples

- Find  $p'(t)$  given  $p(t) = 12t^4 - 6\sqrt{t} = \frac{5}{t}$

- Rewrite  $p(t)$ :  $p(t) = 12t^4 - 6t^{\frac{1}{2}} + 5t^{-1}$

$$p'(t) = 48t^3 - 3t^{-\frac{1}{2}} - 5t^{-2}$$

$$p'(t) = 48t^3 - \frac{3}{\sqrt{t}} - \frac{5}{t^2}$$

# Applications

- Marginal variables can be cost, revenue, and/or profit. Marginal refers to rates of change.
- Since the derivative gives the rate of change of a function, we find the derivative.

# Application Example

- The total cost in hundreds of dollars to produce  $x$  thousand barrels of a beverage is given by
- $C(x) = 4x^2 + 100x + 500$
- Find the marginal cost for  $x = 5$
- $C'(x) = 8x + 100; C'(5) = 140$

# Example Continued

- After 5,000 barrels have been produced, the cost to produce 1,000 more barrels will be approximately \$14,000
- The actual cost will be  $C(6) - C(5)$ : 144 or \$14,400

# Product Rule

## PRODUCT RULE

If  $f(x) = u(x) \cdot v(x)$ , and if  $u'(x)$  and  $v'(x)$  both exist, then

$$f'(x) = u(x) \cdot v'(x) + v(x) \cdot u'(x).$$

(The derivative of a product of two functions is the first function times the derivative of the second, plus the second function times the derivative of the first.)

# Product Rule - Example

- Let  $f(x) = (2x + 3)(3x^2)$ . Find  $f'(x)$

$$f'(x) = u(x) \cdot v'(x) + v(x) \cdot u'(x).$$

- $= (2x + 3)(6x) + (3x^2)(2)$
- $= 12x^2 + 18x + 6x^2 = 18x^2 + 18x$

# Power Rule

- Find  $f'(x)$  given that  $f(x) = (\sqrt{x} + 3)(x^2 - 5x)$

$$\left(x^{\frac{1}{2}} + 3\right)(2x - 5) + (x^2 - 5x)\left(\frac{1}{2}x^{-\frac{1}{2}}\right)$$

$$\frac{5}{2}x^{\frac{3}{2}} + 6x - \frac{15}{2}x^{\frac{1}{2}} - 15$$

# Quotient Rule

## QUOTIENT RULE

If  $f(x) = u(x)/v(x)$ , if all indicated derivatives exist, and if  $v(x) \neq 0$ , then

$$f'(x) = \frac{v(x) \cdot u'(x) - u(x) \cdot v'(x)}{[v(x)]^2}.$$

(The derivative of a quotient is the denominator times the derivative of the numerator, minus the numerator times the derivative of the denominator, all divided by the square of the denominator.)

# Quotient Rule Example

- Find  $f'(x)$  if  $f(x) = \frac{2x-1}{4x+3}$

$$f'(x) = \frac{v(x) \cdot u'(x) - u(x) \cdot v'(x)}{[v(x)]^2}$$

$$= \frac{(4x+3)(2) - (2x-1)(4)}{(4x+3)^2}$$

$$= \frac{10}{(4x+3)^2}$$

# Product & Quotient Rules

• Find  $D_x \left[ \frac{(3-4x)(5x+1)}{7x-9} \right]$

$$\frac{(7x-9)D_x [(3-4x)(5x+1)] - [(3-4x)(5x+1)]D_x (7x-9)}{(7x-9)^2}$$

$$\frac{(7x-9)[(3-4x)(5) + (5x+1)(-4)] - (3+11x-20x^2)(7)}{(7x-9)^2}$$

$$\frac{-140x^2 + 360x - 120}{(7x-9)^2}$$

# Partial differentiation

## Definition of the partial derivative

- the partial derivative of  $f(x,y)$  with respect to  $x$  and  $y$  are

$$\frac{\partial f}{\partial x} = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x, y) - f(x, y)}{\Delta x} = \left(\frac{\partial f}{\partial x}\right)_y = f_x$$

$$\frac{\partial f}{\partial y} = \lim_{\Delta y \rightarrow 0} \frac{f(x, y + \Delta y) - f(x, y)}{\Delta y} = \left(\frac{\partial f}{\partial y}\right)_x = f_y$$

- for general  $n$ -variable

$$\frac{\partial f(x_1, x_2, x_3, \dots, x_n)}{\partial x_i} = \lim_{\Delta x_i \rightarrow 0} \frac{f(x_1, x_2, \dots, x_i + \Delta x_i, \dots, x_n) - f(x_1, x_2, \dots, x_i, \dots, x_n)}{\Delta x_i}$$

- second partial derivatives of two-variable function  $f(x,y)$

$$\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial x}\right) = \frac{\partial^2 f}{\partial x^2} = f_{xx} \quad \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial y}\right) = \frac{\partial^2 f}{\partial y^2} = f_{yy}$$

$$\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y}\right) = \frac{\partial^2 f}{\partial x \partial y} = f_{xy} \quad \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x}\right) = \frac{\partial^2 f}{\partial y \partial x} = f_{yx}$$

# Partial differentiation

## The total differential and total derivative

$$x \rightarrow x + \Delta x \text{ and } y \rightarrow y + \Delta y \Rightarrow f \rightarrow f + \Delta f$$

$$\Delta f = f(x + \Delta x, y + \Delta y) - f(x, y)$$

$$= f(x + \Delta x, y + \Delta y) - f(x, y + \Delta y) + f(x, y + \Delta y) - f(x, y)$$

$$= \left[ \frac{f(x + \Delta x, y + \Delta y) - f(x, y + \Delta y)}{\Delta x} \right] \Delta x + \left[ \frac{f(x, y + \Delta y) - f(x, y)}{\Delta y} \right] \Delta y$$

as  $\Delta x \rightarrow 0$  and  $\Delta y \rightarrow 0$ , the total differential  $df$  is

$$df = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy$$

for n - variable function  $f(x_1, x_2, \dots, x_n)$

$$df = \frac{\partial f}{\partial x_1} dx_1 + \frac{\partial f}{\partial x_2} dx_2 + \dots + \frac{\partial f}{\partial x_n} dx_n$$

**variables  $x_i, i = 1, 2, 3, \dots, n$ , for a given  $x_i = x_i(x_1)$**

**the total derivative of  $f(x_1, x_2, \dots, x_i, \dots, x_n)$  with respect to  $x_1$  is**

$$\frac{df}{dx_1} = \frac{\partial f}{\partial x_1} + \left( \frac{\partial f}{\partial x_2} \right) \frac{dx_2}{dx_1} + \dots + \left( \frac{\partial f}{\partial x_i} \right) \frac{dx_i}{dx_1} + \dots + \left( \frac{\partial f}{\partial x_n} \right) \frac{dx_n}{dx_1}$$

# Partial differentiation

**Ex:** Find the total derivative of  $f(x, y) = x^2 + 3xy$  with respect to  $x$ , given

$y = \sin^{-1} x$  that

$$\frac{\partial f}{\partial x} = 2x + 3y, \quad \frac{\partial f}{\partial y} = 3x; \quad \frac{dy}{dx} = \frac{1}{(1-x^2)^{1/2}}$$

$$\frac{df}{dx} = 2x + 3y + 3x \frac{1}{(1-x^2)^{1/2}} = 2x + 3\sin^{-1} x + \frac{3x}{(1-x^2)^{1/2}}$$

## The chain rule

for  $f = f(x, y)$  and  $x = x(u)$ ,  $y = y(u)$

$$df = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy \Rightarrow \frac{df}{du} = \frac{\partial f}{\partial x} \frac{dx}{du} + \frac{\partial f}{\partial y} \frac{dy}{du}$$

for many variables  $f(x_1, x_2, \dots, x_n)$  and  $x_i = x_i(u)$

$$\Rightarrow \frac{df}{du} = \sum_{i=1}^n \frac{\partial f}{\partial x_i} \frac{dx_i}{du} = \frac{\partial f}{\partial x_1} \frac{dx_1}{du} + \frac{\partial f}{\partial x_2} \frac{dx_2}{du} + \dots + \frac{\partial f}{\partial x_n} \frac{dx_n}{du}$$

# Partial differentiation

## Change of variables

$$f = f(x_1, x_2, \dots, x_n) \text{ and } x_i = x_i(u_1, u_2, \dots, u_m)$$

$$\Rightarrow \frac{\partial f}{\partial u_j} = \sum_{i=1}^n \frac{\partial f}{\partial x_i} \frac{\partial x_i}{\partial u_j} \quad j = 1, 2, \dots, m$$

**Ex:** Polar coordinates  $\rho$  and  $\psi$ , Cartesian coordinates  $x$  and  $y$ ,  $x = \rho \cos \phi$ ,

$y = \rho \sin \phi$ ,  $f(x, y) \rightarrow g(\rho, \phi)$  transform  $\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$  into one in  $\rho$  and  $\phi$

$$\rho^2 = x^2 + y^2, \quad \frac{\partial \rho}{\partial x} = \frac{x}{(x^2 + y^2)^{1/2}} = \cos \phi, \quad \frac{\partial \rho}{\partial y} = \sin \phi$$

$$\phi = \tan^{-1}(y/x), \quad \frac{\partial \phi}{\partial x} = \frac{-y/x^2}{1+(y/x)^2} = \frac{-y}{x^2 + y^2} = \frac{-\rho \sin \phi}{\rho^2} = \frac{-\sin \phi}{\rho}, \quad \frac{\partial \phi}{\partial y} = \frac{\cos \phi}{\rho}$$

$$\frac{\partial}{\partial x} = \frac{\partial \rho}{\partial x} \frac{\partial}{\partial \rho} + \frac{\partial \phi}{\partial x} \frac{\partial}{\partial \phi} = \cos \phi \frac{\partial}{\partial \rho} - \frac{\sin \phi}{\rho} \frac{\partial}{\partial \phi}, \quad \frac{\partial}{\partial y} = \sin \phi \frac{\partial}{\partial \rho} + \frac{\cos \phi}{\rho} \frac{\partial}{\partial \phi}$$

$$\frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial x} \right) \text{ and } \frac{\partial^2}{\partial y^2} = \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial y} \right) \Rightarrow \nabla^2 f(x, y) = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = \frac{\partial^2 g}{\partial \rho^2} + \frac{1}{\rho} \frac{\partial g}{\partial \rho} + \frac{1}{\rho^2} \frac{\partial^2 g}{\partial \phi^2}$$
