

The background of the slide features a close-up, slightly blurred image of a pencil with a red eraser and a sharpened lead tip, resting on a piece of graph paper. The pencil is oriented diagonally from the bottom left towards the top right. The graph paper has a grid of small squares, and some numbers are faintly visible, including '15', '16', and '17' in the upper right quadrant. The overall color palette is warm, with shades of beige, brown, and orange.

LINKED LIST

A **LINKED LIST** IS A DATA STRUCTURE CONSISTING OF A GROUP OF NODES WHICH TOGETHER REPRESENT A SEQUENCE.

Linked List

- A linked list consists of:
 - ▣ A sequence of **nodes**

Each node contains a **value**
and a **link** (pointer or reference) to some other
node

The last node contains a **null link**

The list may (or may not) have a **header**

Basic Terminology

A node's **successor** is the next node in the sequence

The last node has no successor

A node's **predecessor** is the previous node in the sequence

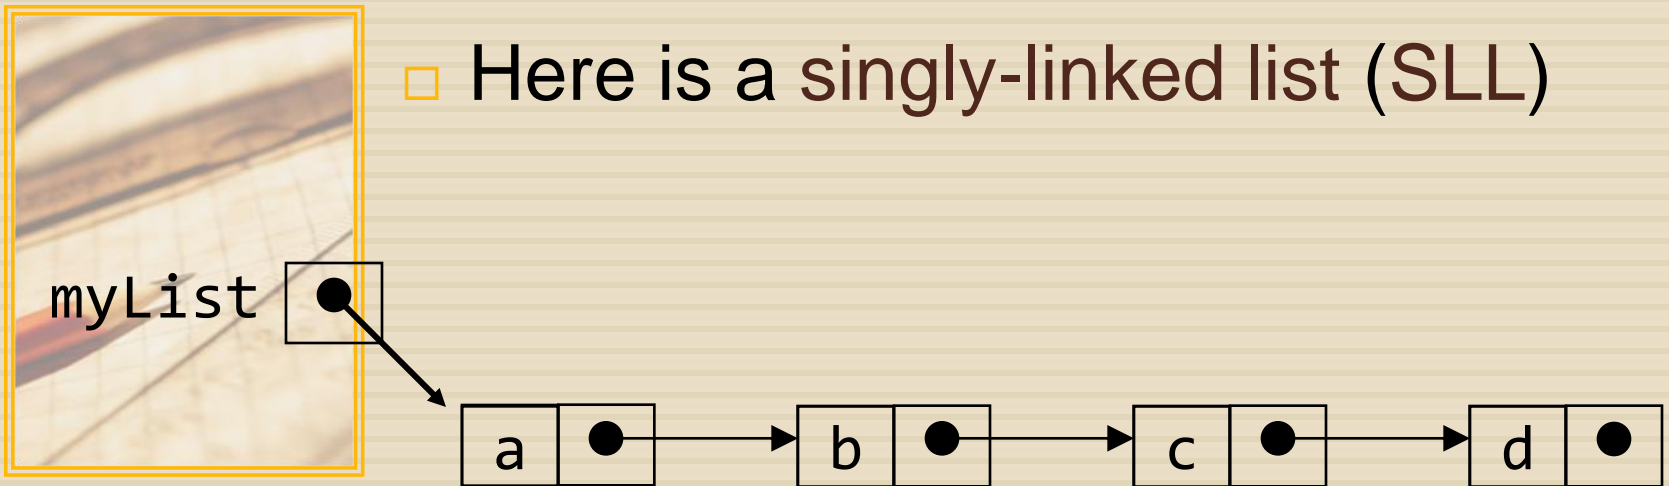

The first node has no predecessor

A list's **length** is the number of elements in it

A list may be **empty** (contain no elements)

Singly-linked lists

- Here is a singly-linked list (SLL)

Each node contains a value and a link to its successor (the last node has no successor).

The header points to the first node in the list (or contains the null link if the list is empty)

Doubly Linked List

□ DLL

Each node contains a value, a link to its successor (if any), *and* a link to its predecessor (if any)

The header points to the first node in the list *and* to the last node in the list (or contains null links if the list is empty)

- info: the user's data
- next, back: the address of the next and previous node in the list

Circular Linked List

- Circular linked list is a linked list where the last node of the linked list is pointing to the first node of the linked list

- We need two pointers
 - ▣ A head pointer – pointing to the first node
 - ▣ A rear pointer – pointing to the last node

When is a circular LL is used?

- When we need to traverse from the last node to first node without having to traverse backwards.
- Overcome the limitation of Doubly Linked List.

Implementation

- Can be implemented using
 - ▣ Singly linked list
 - ▣ Doubly linked list

Operation On Linked List

- Insertion : we add one node to a list
- Deletion: we delete an node from a list
- Traversing : we traverse a node.
