

Stable, Linear and Time invariant systems

Time Invariant and Time Variant Systems

- A system is said to be *time invariant* if a time delay or time advance of the input signal leads to an identical time shift in the output signal.

$$\begin{aligned}y_i(t) &= H\{x(t - t_0)\} \\ &= H\{S^{t_0}\{x(t)\}\} = HS^{t_0}\{x(t)\} \\ y_0(t) &= S^{t_0}\{y(t)\} \\ &= S^{t_0}\{H\{x(t)\}\} = S^{t_0}H\{x(t)\}\end{aligned}$$

Stable & Unstable Systems

- A system is said to be *bounded-input bounded-output stable* (BIBO stable) iff every bounded input results in a bounded output.

i.e.

$$\forall t \quad |x(t)| \leq M_x < \infty \rightarrow \forall t \quad |y(t)| \leq M_y < \infty$$

Stable & Unstable Systems Contd.

Example

$$- y[n] = \frac{1}{3}(x[n] + x[n-1] + x[n-2])$$

$$\begin{aligned} |y[n]| &= \frac{1}{3} |x[n] + x[n-1] + x[n-2]| \\ &\leq \frac{1}{3} (|x[n]| + |x[n-1]| + |x[n-2]|) \\ &\leq \frac{1}{3} (M_x + M_x + M_x) = M_x \end{aligned}$$

Stable & Unstable Systems Contd.

Example: The system represented by

$$y(t) = A x(t) \text{ is unstable ; } A > 1$$

Reason: let us assume $x(t) = u(t)$, then at every instant $u(t)$ will keep on multiplying with A and hence it will not be bounded.

Static & Dynamic Systems Contd.

- A dynamic system possesses memory
- It has the storage devices
- A system is said to possess *memory* if its output signal depends on past values and future values of the input signal

$$i(t) = \frac{1}{L} \int_{-\infty}^t v(\tau) d\tau$$

$$y[n] = x[n] + x[n-1]$$

Example: Static or Dynamic?

Example: Static or Dynamic?

Answer:

- The system shown above is RC circuit
- R is memoryless
- C is memory device as it stores charge because of which voltage across it can't change immediately
- Hence given system is dynamic or memory system

Invertible & Inverse Systems

- If a system is invertible it has an **Inverse System**

- Example: $y(t)=2x(t)$
 - System is invertible \rightarrow must have inverse, that is:
 - For any $x(t)$ we get a distinct output $y(t)$
 - Thus, the system must have an Inverse
 - $x(t)=1/2 y(t)=z(t)$
