

Initial and Final Value theorems

The Laplace Transform

Theorem:

Initial Value

Theorem:

If the function $f(t)$ and its first derivative are Laplace transformable and $f(t)$ has the Laplace transform $F(s)$, and the $\lim_{s \rightarrow \infty} sF(s)$ exists, then

$$\lim_{s \rightarrow \infty} sF(s) = \lim_{t \rightarrow 0} f(t) = f(0)$$

*Initial Value
Theorem*

The utility of this theorem lies in not having to take the inverse of $F(s)$ in order to find out the initial condition in the time domain. This is particularly useful in circuits and systems.

The Laplace Transform

Example: Initial Value Theorem:

Given;

$$F(s) = \frac{(s+2)}{(s+1)^2 + 5^2}$$

Find $f(0)$

$$\begin{aligned} f(0) &= \lim_{s \rightarrow \infty} sF(s) = \lim_{s \rightarrow \infty} s \frac{(s+2)}{(s+1)^2 + 5^2} = \lim_{s \rightarrow \infty} \left[\frac{s^2 + 2s}{s^2 + 2s + 1 + 25} \right] \\ &= \lim_{s \rightarrow \infty} \frac{s^2/s^2 + 2s/s^2}{s^2/s^2 + 2s/s^2 + (26/s^2)} = 1 \end{aligned}$$

The Laplace Transform

Theorem:

Final Value

Theorem:

If the function $f(t)$ and its first derivative are Laplace transformable and $f(t)$ has the Laplace transform $F(s)$, and the $\lim_{s \rightarrow \infty} sF(s)$ exists, then

$$\lim_{s \rightarrow 0} sF(s) = \lim_{t \rightarrow \infty} f(t) = f(\infty)$$

*Final Value
Theorem*

Again, the utility of this theorem lies in not having to take the inverse of $F(s)$ in order to find out the final value of $f(t)$ in the time domain. This is particularly useful in circuits and systems.

The Laplace Transform

Example: Final Value Theorem:

Given:

$$F(s) = \frac{(s+2)^2 - 3^2}{(s+2)^2 + 3^2} \quad \text{note } F^{-1}(s) = te^{-2t} \cos 3t$$

Find $f(\infty)$.

$$f(\infty) = \lim_{s \rightarrow 0} sF(s) = \lim_{s \rightarrow 0} s \frac{(s+2)^2 - 3^2}{(s+2)^2 + 3^2} = 0$$
