

# IDMT Relay Characteristics

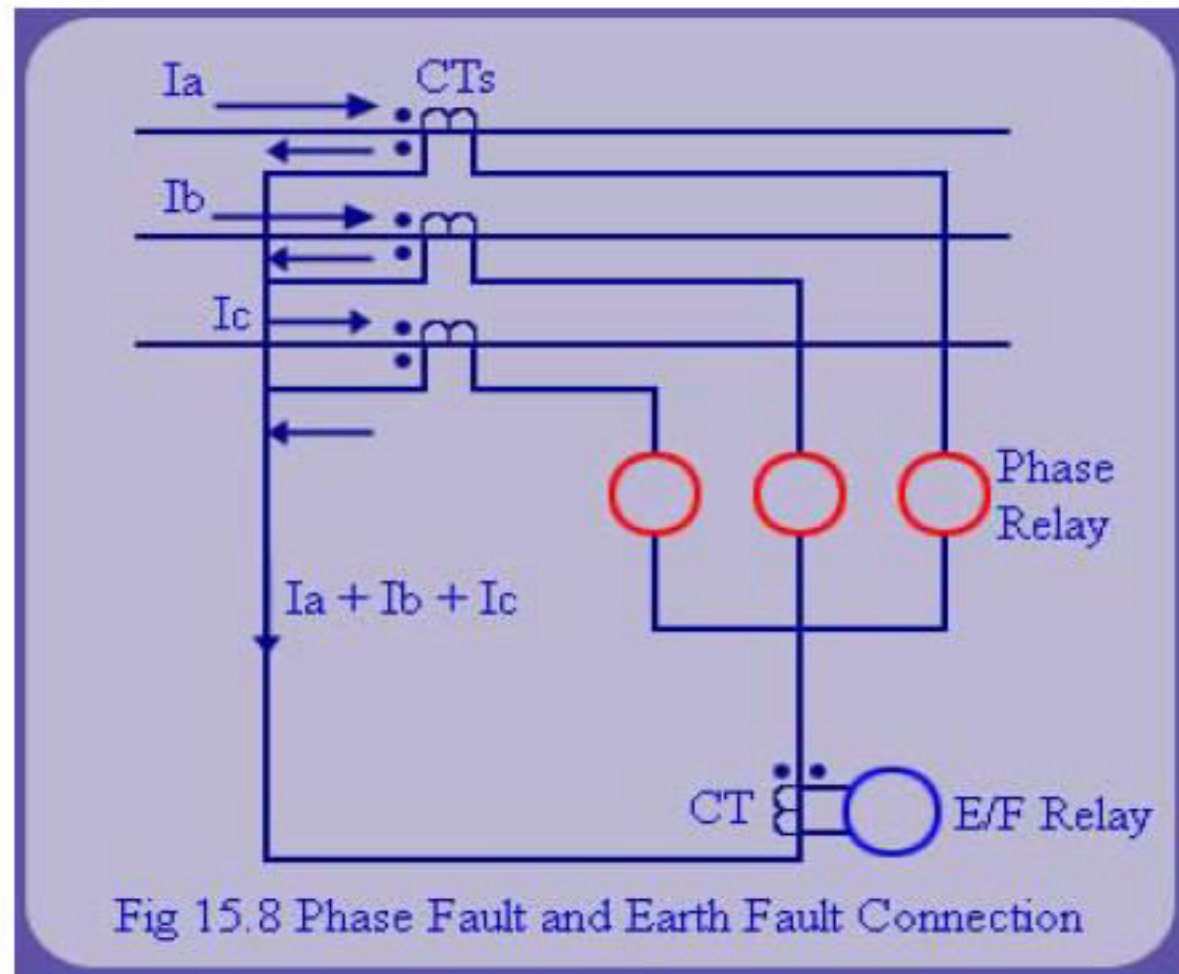

# Overcurrent Protection Using Definite Time Relay

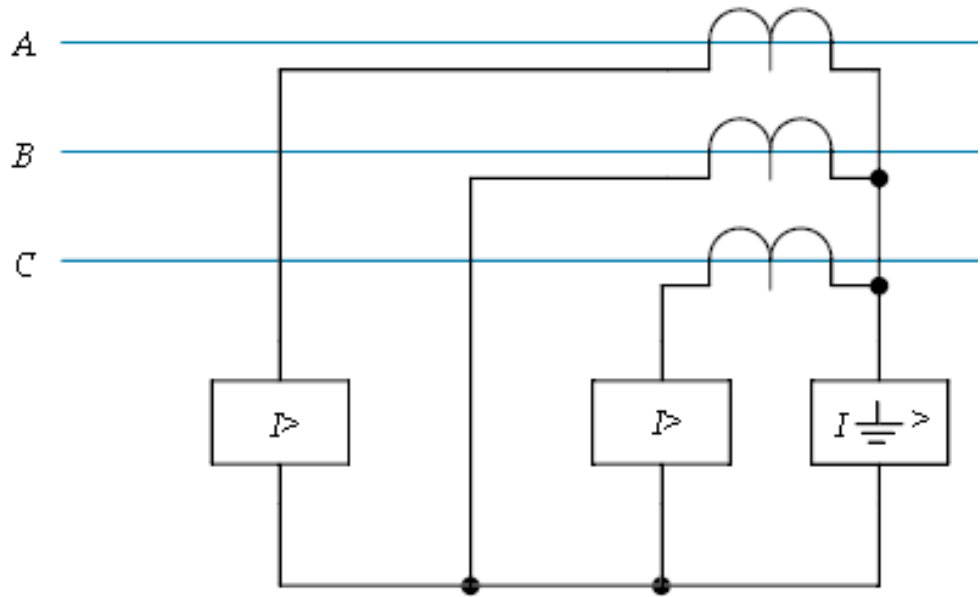

- $R_1$  trips without any intentional time delay.
- $R_2$  has to coordinate with  $R_1$  and its operation is delayed by CTI.
- $R_3$  has to back up  $R_2$  and it is again time delayed.

## Faults are classified into two:

- Phase fault which do not involve ground.
- Earth fault which involve ground.

## Guidelines for Setting Pickup Current for Phase Fault Relays

- Pickup current should be above the maximum load current.
- Pickup current should be below minimum fault current.
- Pickup current should also be below the minimum fault current of the feeder that it has to back up.
- The back up relay also should provide time for primary relay to operate. This time interval is known as coordination time interval.
