

# Classification Of Choppers

- Choppers are classified as
  - Class A Chopper
  - Class B Chopper
  - Class C Chopper
  - Class D Chopper
  - Class E Chopper

# Class A Chopper

- When chopper is *ON*, supply voltage  $V$  is connected across the load.
- When chopper is *OFF*,  $v_o = 0$  and the load current continues to flow in the same direction through the FWD.
- The average values of output voltage and current are always positive.
- *Class A Chopper* is a first quadrant chopper .

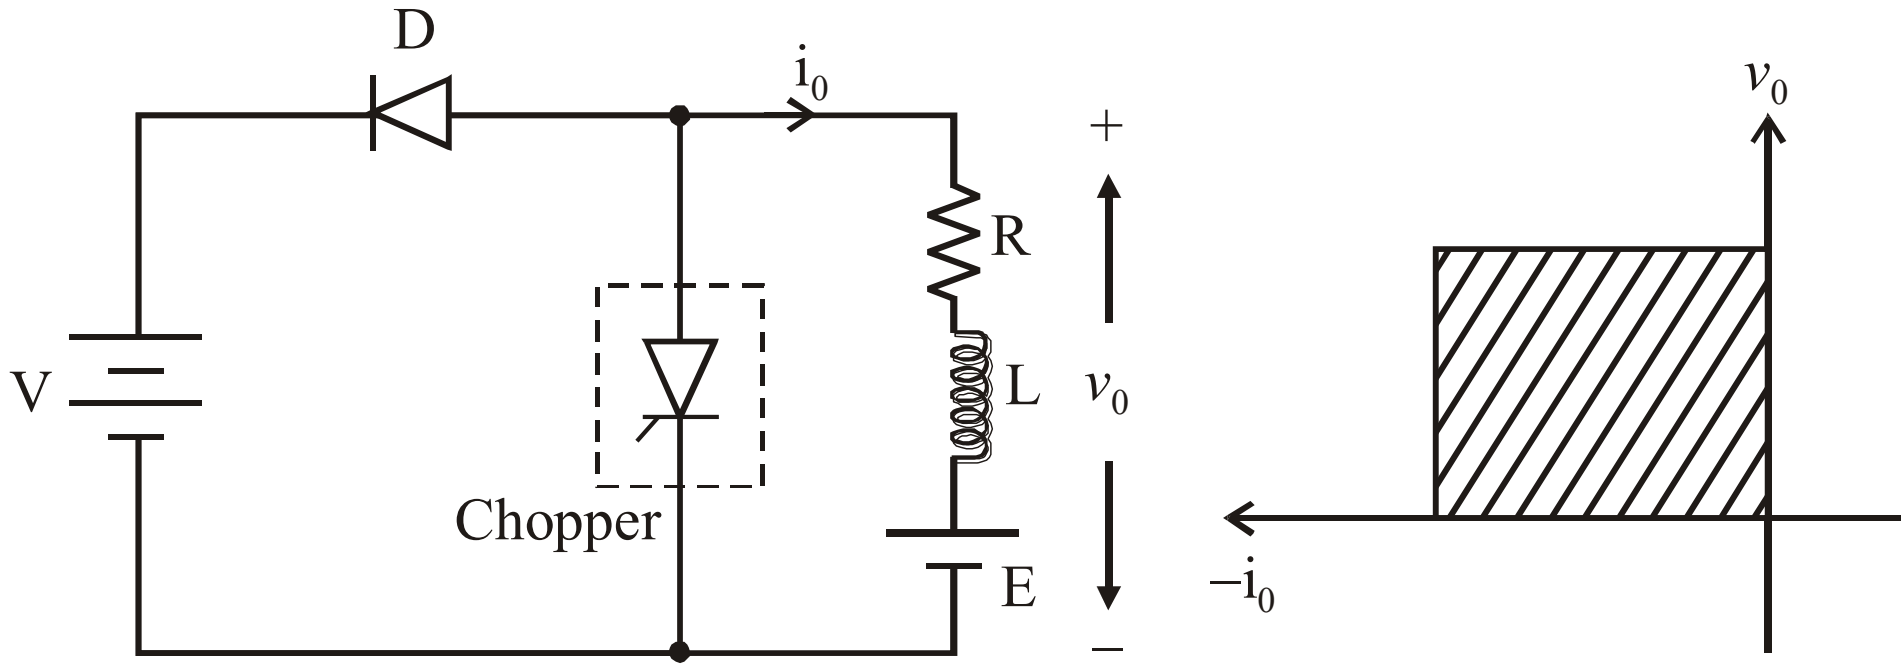

- *Class A Chopper* is a step-down chopper in which power always flows from source to load.
- It is used to control the speed of dc motor.
- The output current equations obtained in step down chopper with  $R-L$  load can be used to study the performance of *Class A Chopper*.

# Class B Chopper

- When chopper is ON,  $E$  drives a current through  $L$  and  $R$  in a direction opposite to that shown in figure.
- During the ON period of the chopper, the inductance  $L$  stores energy.
- When Chopper is OFF, diode  $D$  conducts, and part of the energy stored in inductor  $L$  is returned to the supply.

- Average output voltage is positive.
- Average output current is negative.
- Therefore *Class B Chopper* operates in second quadrant.
- In this chopper, power flows from load to source.
- *Class B Chopper* is used for regenerative braking of dc motor.
- *Class B Chopper* is a step-up chopper.
