

## **UNIT IV**

# **STABILITY ANALYSIS**

# Transient Stability Solution Methods

- ⑩ There are two methods for solving the transient stability problem
  1. Numerical integration
    - this is by far the most common technique, particularly for large systems; during the fault and after the fault the power system differential equations are solved using numerical methods
  2. Direct or energy methods; for a two bus system this method is known as the equal area criteria
    - mostly used to provide an intuitive insight into the transient stability problem

# Numerical Integration of DEs

Assume we have a problem of the form

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, t) \quad \text{with} \quad \mathbf{x}(t_0) = \mathbf{x}_0$$

This is known as an initial value problem since the initial value of  $\mathbf{x}$  is given at some value of time,  $t_0$ .

We then need to determine  $\mathbf{x}(t)$  for future time.

Except for special cases, such as linear systems, no analytic solution is possible. We must use numerical techniques.

# Examples

## Example 1: Exponential Decay

A simple example with an analytic solution is

$$\dot{x} = -x \quad \text{with } x(0) = x_0$$

This has a solution  $x(t) = x_0 e^{-t}$

## Example 2: Mass-Spring System

$$kx - gM = M\ddot{x}$$

or

$\therefore$

$$\therefore \begin{bmatrix} 1 \\ -M \end{bmatrix} (kx_1 - gM - Dx_2)$$

# Euler's Method

The simplest technique for numerically integrating these equations is known as Euler's method. Key idea

is to approximate  $\frac{d\mathbf{x}}{dt}$  as  $\frac{\Delta\mathbf{x}}{\Delta t}$

Then

$$\mathbf{x}(t + \Delta t) \approx \mathbf{x}(t) + \Delta t \mathbf{f}(\mathbf{x}(t))$$

In general the smaller the time step,  $\Delta t$ , the better the approximation.

# Euler's Method Algorithm

Set  $t = t_0$  (usually 0)

$$\mathbf{x}(t_0) = \mathbf{x}_0$$

Pick the time step  $\Delta t$ , which is problem specific

While  $t \leq t^{\text{end}}$  Do

$$\mathbf{x}(t + \Delta t) = \mathbf{x}(t) + \Delta t \mathbf{f}(\mathbf{x}(t))$$

$$t = t + \Delta t$$

End While

# Euler's Method Example 1

Consider the Exponential Decay Example

$$\dot{x} = -x \quad \text{with } x(0) = x_0$$

This has a solution  $x(t) = x_0 e^{-t}$

Since we know the solution we can compare the accuracy of Euler's method for different time steps

# Euler's Method Example 1, cont'd

<b>t</b>	<b><math>x^{\text{actual}}(t)</math></b>	<b><math>x(t) \Delta t=0.1</math></b>	<b><math>x(t) \Delta t=0.05</math></b>
<b>0</b>	<b>10</b>	<b>10</b>	<b>10</b>
<b>0.1</b>	<b>9.048</b>	<b>9</b>	<b>9.02</b>
<b>0.2</b>	<b>8.187</b>	<b>8.10</b>	<b>8.15</b>
<b>0.3</b>	<b>7.408</b>	<b>7.29</b>	<b>7.35</b>
<b>...</b>	<b>...</b>	<b>...</b>	<b>...</b>
<b>1.0</b>	<b>3.678</b>	<b>3.49</b>	<b>3.58</b>
<b>...</b>	<b>...</b>	<b>...</b>	<b>...</b>
<b>2.0</b>	<b>1.353</b>	<b>1.22</b>	<b>1.29</b>

# Euler's Method Example 2

Consider the equations describing the horizontal position of a cart attached to a lossless spring:

$$\begin{aligned} \dot{x}_1 &= x_2 \\ \dot{x}_2 &= -x_1 \end{aligned}$$

Assuming initial conditions of  $x_1(0) = 1$  and  $x_2(0) = 0$ , the analytic solution is  $x_1(t) = \cos t$ .

We can again compare the results of the analytic and numerical solutions

# Euler's Method Example 2, cont'd

Starting from the initial conditions at  $t = 0$  we next calculate the value of  $x(t)$  at time  $t = 0.25$ .

$$x_1(0.25) = x_1(0) + 0.25 x_2(0) = 1.0$$

$$x_2(0.25) = x_2(0) - 0.25 x_1(0) = -0.25$$

Then we continue on to the next time step,  $t = 0.50$

$$\begin{aligned} x_1(0.50) &= x_1(0.25) + 0.25 x_2(0.25) = \\ &= 1.0 + 0.25 \times (-0.25) = 0.9375 \end{aligned}$$

$$\begin{aligned} x_2(0.50) &= x_2(0.25) - 0.25 x_1(0.25) = \\ &= -0.25 - 0.25 \times (1.0) = -0.50 \end{aligned}$$

# Euler's Method Example 2, cont'd

<b>t</b>	<b><math>x_1^{\text{actual}}(t)</math></b>	<b><math>x_1(t) \Delta t=0.25</math></b>
<b>0</b>	<b>1</b>	<b>1</b>
<b>0.25</b>	<b>0.9689</b>	<b>1</b>
<b>0.50</b>	<b>0.8776</b>	<b>0.9375</b>
<b>0.75</b>	<b>0.7317</b>	<b>0.8125</b>
<b>1.00</b>	<b>0.5403</b>	<b>0.6289</b>
<b>...</b>	<b>...</b>	<b>...</b>
<b>10.0</b>	<b>-0.8391</b>	<b>-3.129</b>
<b>100.0</b>	<b>0.8623</b>	<b>-151,983</b>

# Euler's Method Example 2, cont'd

Below is a comparison of the solution values for  $x_1(t)$  at time  $t = 10$  seconds

$\Delta t$	$x_1(10)$
<b>actual</b>	<b>-0.8391</b>
<b>0.25</b>	<b>-3.129</b>
<b>0.10</b>	<b>-1.4088</b>
<b>0.01</b>	<b>-0.8823</b>
<b>0.001</b>	<b>-0.8423</b>

**Thank you**
