Introduction

Jean Baptiste Joseph Fourier
(Mar21st 1768 –May16th 1830)
French mathematician, physicist

Main Work:
Théorie analytique de la chaleur
(The Analytic Theory of Heat)

- Any function of a variable, whether continuous or discontinuous, can be expanded in a series of sines of multiples of the variable (Incorrect)
- The concept of dimensional homogeneity in equations
- Proposal of his partial differential equation for conductive diffusion of heat

Discovery of the "greenhouse effect"

Fourier Transform

- Transition from Fourier integral to Fourier transform

$$f(x) = \int_0^{\infty}[a(\omega)\cos\omega x + b(\omega)\sin\omega x]d\omega. \quad (1a)$$

Where $a(\omega) = \frac{1}{\pi}\int_{-\infty}^{\infty} f(x)\cos\omega x\, dx, \quad (1b)$

$$b(\omega) = \frac{1}{\pi}\int_{-\infty}^{\infty} f(x)\sin\omega x\, dx.$$

Put (1b) into (1a):

$$f(x) = \frac{1}{\pi}\int_0^{\infty}\{\int_{-\infty}^{\infty} f(\xi)[\cos\omega\xi\cos\omega x + \sin\omega\xi\sin\omega x]d\xi\}d\omega$$

$$= \frac{1}{\pi}\int_0^{\infty}\int_{-\infty}^{\infty} f(\xi)\cos\omega(\xi - x)d\xi d$$

- Since cos(A-B)=cosAcosB+sinAsinB and introduce complex exponentials:

$$f(x) = \frac{1}{\pi}\int_0^\infty \int_{-\infty}^\infty f(\xi)\frac{e^{i\omega(\xi-x)} + e^{-i\omega(\xi-x)}}{2}\mathrm{d}\xi d\omega$$
$$= \frac{1}{2\pi}\int_0^\infty \int_{-\infty}^\infty f(\xi)e^{i\omega(\xi-x)}\mathrm{d}\xi d\omega + \frac{1}{2\pi}\int_0^\infty \int_{-\infty}^\infty f(\xi)e^{-i\omega(\xi-x)}\mathrm{d}\xi d\omega$$

To combine the two terms on the right-hand side, let us change the dummy integration variable from ωto – ω:

$$f(x) = \frac{1}{2\pi}\int_0^{-\infty} \int_{-\infty}^\infty f(\xi)e^{-i\omega(\xi-x)}\mathrm{d}\xi(-d\omega)$$
$$+ \frac{1}{2\pi}\int_0^\infty \int_{-\infty}^\infty f(\xi)e^{-i\omega(\xi-x)}\mathrm{d}\xi d\omega$$
$$= \frac{1}{2\pi}\int_{-\infty}^\infty [\int_{-\infty}^\infty f(\xi)e^{-i\omega\xi}\mathrm{d}\xi]e^{i\omega x}d\omega$$

- Thus,

$$f(x) = a\int_{-\infty}^{\infty} c(\omega)e^{i\omega \mathrm{x}}d\omega \; c(\omega) = b\int_{-\infty}^{\infty} f(\xi)e^{-i\omega\xi}\mathrm{d}\xi \mathrm{ab}=1/2\pi$$

There is no longer a need to distinguish x and ξ, so:

$$f(x) = \frac{1}{2\pi}\int_{-\infty}^{\infty} c(\omega)e^{i\omega \mathrm{x}}d\omega$$
$$c(\omega) = \int_{-\infty}^{\infty} f(x)e^{-i\omega x}\mathrm{d}x.$$

Fourier transform

- $f(x) = \frac{1}{2\pi}\int_{-\infty}^{\infty} c(\omega)e^{i\omega x}d\omega,$ (1)

$c(\omega) = \int_{-\infty}^{\infty} f(x)e^{-i\omega x}\mathrm{d}x.$ (2)

They can be a transform pair: (2) defines the **Fourier transform**, c(w), of the given function *f*(x), and (1) is called the **inversion formula**.

$F\{f(x)\} = \hat{f}(\omega) = \int_{-\infty}^{\infty} c(\omega)e^{-i\omega x}dx,$

$F^{-1}\{\hat{f}(\omega)\} = f(x) = \frac{1}{2\pi}\int_{-\infty}^{\infty} \hat{f}(\omega)e^{i\omega x}d\omega.$

Example:

Derive the result $F\left\{e^{-a|x|}\right\}=\dfrac{2a}{\omega^2+a^2}$ (a>0)

Solution:

According to the definition $F\{f(x)\}=\hat{f}(\omega)=\int_{-\infty}^{\infty} f(x)e^{-i\omega x}dx$

Then

$$F\left\{e^{-a|x|}\right\}=\int_{-\infty}^{\infty} e^{-a|x|}e^{-i\omega x}dx=\int_{-\infty}^{0} e^{ax}e^{-i\omega x}dx+\int_{0}^{\infty} e^{-ax}e^{-i\omega x}dx=\frac{1}{a-i\omega}+\frac{1}{a+i\omega}=\frac{2a}{a+\omega^2}$$

Properties and applications

1. Linearity of the transform and its inverse.

$F\{af+bg\}=aF\{f\}+bF\{g\}$

$F^{-1}\{a\hat{f}+b\hat{g}\}=aF^{-1}\{\hat{f}\}+bF^{-1}\{\hat{g}\}$

2. Transform of *n*th derivative.

$$F\{f^{(n)}(x)\} = (i\omega)^n \hat{f}(\omega).$$

3.Fourier convolution.

$$(f * g)(\mathrm{x}) = \int_{-\infty}^{\infty} f(x-\xi)g(\xi)d\xi.$$

Then the Fourier convolution theorem:

$\mathrm{F}\{f * g\} = \hat{f}(\omega)\hat{g}(\omega)$ and $\mathrm{F}^{-1}\{\hat{f}\hat{g}\}=f^{*}g$

4. Translation formulas, x-shift and ω-shift

$$F\{f(x-a)\} = e^{-ia\omega}\hat{f}(\omega)$$
$$F^{-1}\{\hat{f}(\omega-\mathrm{a})\} = e^{ia\omega}f(x)$$

Example:

Solve the wave equation $c^2 u_{xx} = u_{tt};\ u(x,0) = f(x)$ and $u_t(x,0) = g(x)$

Take the Fourier Transform of both equations. The initial condition gives

$$\hat{u}(\omega,0) = \hat{f}(\omega)$$

$$\hat{u}_t(\omega,0) = \frac{\partial}{\partial t}\hat{u}(x,t)\Big|_{t=0} = \hat{g}(\omega)$$

And the PDE gives

$$c^2(-\omega^2 \hat{u}(\omega,t)) = \frac{\partial^2}{\partial t^2}\hat{u}(\omega,t)$$

Which is basically an ODE in t, we can write it as

$$\frac{\partial^2}{\partial t^2}\hat{u}(\omega,t) + c^2\omega^2 \hat{u}(\omega,t) = 0$$

Which has the solution, and derivative

$$\hat{u}(\omega,t) = A(\omega)\cos c\omega t + B(\omega)\sin c\omega t$$

$$\frac{\partial}{\partial t}\hat{u}(\omega,t) = -c\omega A(\omega)\sin c\omega t + c\omega B(\omega)\cos c\omega t$$

So the first initial condition gives $A(\omega) = \hat{f}(\omega)$ and the second gives

$c\omega B(\omega) = \hat{g}(\omega)$ and make the solution

$$\hat{u}(\omega, t) = \hat{f}(\omega)\cos c\omega t + \frac{\hat{g}(\omega)}{\omega}\frac{\sin c\omega t}{c}$$

Let's first look at

$$\hat{f}(\omega)\cos c\omega t = \hat{f}(\omega)(\frac{e^{i\omega ct} + e^{-i\omega t}}{2}) = \frac{1}{2}(\hat{f}(\omega)e^{ic\omega t} + \hat{f}(\omega)e^{-i\omega ct})$$

Then

$$F^{-1}[\hat{f}(\omega)\cos c\omega t] = \frac{1}{2}(f(x+ct) + f(x-ct))$$

The second piece

$$\frac{\hat{g}(\omega)}{\omega}\frac{\sin c\omega t}{c} = \frac{\hat{g}(\omega)}{i\omega}\frac{\sin c\omega t}{-ic}$$

And now the first factor looks like an integral, as a derivative with respect to x would cancel the iw in bottom. Define:

$$h(x) = \int_{s=0}^{x} g(s)ds$$

By fundamental theorem of calculus

$$h'(x) = g(x) \qquad \hat{g}(\omega) = i\omega \hat{h}(\omega)$$

So $$\frac{\hat{g}(\omega)}{\omega}\frac{\sin c\omega t}{c} = \hat{h}(\omega)(\frac{e^{ic\omega t} - e^{-ic\omega t}}{2i})\frac{1}{-ic} = \frac{1}{2c}(\hat{h}(\omega)e^{ic\omega t} - \hat{h}(\omega)e^{-ic\omega t})$$

$$F^{-1}[\frac{1}{\omega c}\hat{g}(\omega)\sin c\omega t] = \frac{1}{2c}(h(x+ct) - h(x-ct)) = \frac{1}{2c}(\int_0^{x+ct} g(s)ds - \int_0^{x-ct} g(s)ds) = \frac{1}{2c}\int_{x-ct}^{x+ct} g(s)ds$$

Putting both piece together we get the solution

$$u(x,t) = \frac{1}{2}(f(x-ct) + f(x+ct)) + \frac{1}{2c}\int_{x-ct}^{x+ct} g(s)ds$$

Cosine and sine transforms

1.Fourier cosine transform

$$F_C\{f(x)\} = \hat{f}_C(\omega) = \int_0^{\infty} f(x) cos\omega x dx,$$

And its inverse:

$$F_C^{-1}\{\hat{f}_C(\omega)\} = f(x) = \frac{2}{\pi}\int_0^{\infty} \hat{f}_C(\omega)\, cos\omega x\, d\omega.$$

a.Fourier sine transform

$$F_S\{f(x)\} = \hat{f}_S(\omega) = \int_0^\infty f(x) sin\omega x dx,$$

And its inverse:

$$F_S^{-1}\{\hat{f}_S(\omega)\} = f(x) = \frac{2}{\pi}\int_0^\infty \hat{f}_S(\omega)\, sin\, \omega x\, d\omega$$

Properties:

$$F_C\{f'(x)\} = \omega\hat{f}_S(\omega) - f(0)$$

$$F_S\{f'(x)\} = -\omega\hat{f}_C(\omega).$$

$$F_C\{f''(x)\} = -\omega^2\hat{f}_C(\omega) - f'(0).$$

$$F_S\{f''(x)\} = -\omega^2\hat{f}_S(\omega) + \omega f(0)$$

Example:

Solve heat transfer equation $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ B.C: (1) u(0,t)=0

(2)u(x,0)=P(x) $1 \le x \le 2$ or P(x)=1,

Solution with Fourier Sine Transform:

$$F_s\{u"-u'\} = F_s\{0\}$$

$$F_s\{u"\} = F_s\{u'\}$$

$$-\omega^2 \hat{f}_s + \omega f_0 = -\omega \hat{f}_c(\omega) = \frac{\partial \hat{f}_s}{\partial t}$$

According to the B.C, we can get

$$f_0 = 0 \qquad -\omega^2 \hat{f}_s(\omega,t) = \frac{\partial \hat{f}_s(\omega,t)}{\partial t} \qquad \hat{f}_s(\omega,t) = \hat{f}_s(\omega,0)\exp(-\omega^2 t)$$

Then $\hat{f}_s(\omega,0) = (2/\pi)\int_0^\infty u(x,0)\sin(\omega x)dx = (2/\pi)\int_0^\infty P(x)\sin(\omega x)dx = (2/\omega\pi)[\cos\omega - \cos 2\omega]$

$$\hat{f}_s(\omega,t) = \hat{f}_s(\omega,0)\exp(-\omega^2 t) = (2/\omega\pi)[\cos\omega - \cos 2\omega]\exp(-\omega^2 t)$$

Inverse $\hat{f}_s(\omega,t)$ Gives the complete solution

$$u(x,t) = \int_0^\infty \hat{f}_s(\omega,t)\sin(\omega t)d\omega = \int_0^\infty (2/\omega\pi)\left(\cos(\omega) - \cos(2\omega)\right)\exp(-\omega^2 t)\sin(\omega x)d\omega$$

Fourier Transform of the Unit-Step Function

- Since

$$u(t) = \int_{-\infty}^{t} \delta(\tau)d\tau$$

using the integration property, it is

$$u(t) = \int_{-\infty}^{t} \delta(\tau)d\tau \leftrightarrow \frac{1}{j\omega} + \pi\delta(\omega)$$

Properties of the Fourier Transform - Summary

TABLE 4.1 PROPERTIES OF THE FOURIER TRANSFORM

Property	Transform Pair/Property
Linearity	$ax(t) + bv(t) \leftrightarrow aX(\omega) + bV(\omega)$
Right or left shift in time	$x(t - c) \leftrightarrow X(\omega)e^{-j\omega c}$
Time scaling	$x(at) \leftrightarrow \frac{1}{a}X\left(\frac{\omega}{a}\right) \quad a > 0$
Time reversal	$x(-t) \leftrightarrow X(-\omega) = \overline{X(\omega)}$
Multiplication by a power of t	$t^n x(t) \leftrightarrow j^n \frac{d^n}{d\omega^n}X(\omega) \quad n = 1, 2, \ldots$
Multiplication by a complex exponential	$x(t)e^{j\omega_0 t} \leftrightarrow X(\omega - \omega_0) \quad \omega_0$ real
Multiplication by sin $\omega_0 t$	$x(t) \sin \omega_0 t \leftrightarrow \frac{j}{2}[X(\omega + \omega_0) - X(\omega - \omega_0)]$
Multiplication by cos $\omega_0 t$	$x(t) \cos \omega_0 t \leftrightarrow \frac{1}{2}[X(\omega + \omega_0) + X(\omega - \omega_0)]$
Differentiation in the time domain	$\frac{d^n}{dt^n}x(t) \leftrightarrow (j\omega)^n X(\omega) \quad n = 1, 2, \ldots$
Integration	$\int_{-\infty}^{t} x(\lambda)\, d\lambda \leftrightarrow \frac{1}{j\omega}X(\omega) + \pi X(0)\delta(\omega)$
Convolution in the time domain	$x(t) * v(t) \leftrightarrow X(\omega)V(\omega)$
Multiplication in the time domain	$x(t)v(t) \leftrightarrow \frac{1}{2\pi}X(\omega) * V(\omega)$
Parseval's theorem	$\int_{-\infty}^{\infty} x(t)v(t)\, dt = \frac{1}{2\pi}\int_{-\infty}^{\infty} \overline{X(\omega)}V(\omega)\, d\omega$
Special case of Parseval's theorem	$\int_{-\infty}^{\infty} x^2(t)\, dt = \frac{1}{2\pi}\int_{-\infty}^{\infty} \lvert X(\omega)\rvert^2\, d\omega$
Duality	$X(t) \leftrightarrow 2\pi x(-\omega)$

Example :

The property of Fourier transform of derivatives can be used for solution of differential equations:

$$y' - 4y = H(t)e^{-4t}$$

$$H(t) = \begin{cases} 0 & t < 0 \\ 1 & t \geq 0 \end{cases}$$

$$F\{y'\} - 4F\{y\} = F\{H(t)e^{-4t}\} = \frac{1}{4+iw}$$

Setting *F{y(t)}=Y(w)*, we have

$$iwY(w) - 4Y(w) = \frac{1}{4+iw}$$

Example :

Then

$$Y(w) = \frac{1}{(4+iw)(-4+iw)} = -\frac{1}{16+w^2}$$

Therefore

$$y(w) = F^{-1}\{Y(w)\} = -\frac{1}{8}e^{-4|t|}$$
