## What is Modulation?

In modulation, a <u>message</u> signal, which contains the <u>information</u> is used to control the parameters of a <u>carrier</u> signal, so as to impress the information onto the carrier.

#### **The Messages**

The message or modulating signal may be either: analogue – denoted by m(t) digital – denoted by d(t) – i.e. sequences of 1's and 0's The message signal could also be a multilevel signal, rather than binary; this is not considered further at this stage.

#### **The Carrier**

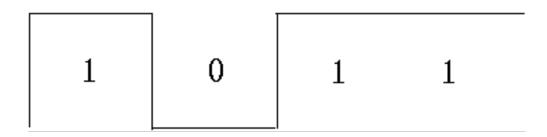

The carrier could be a 'sine wave' or a 'pulse train'. Consider a 'sine wave' carrier:

- If the message signal m(t) controls amplitude gives AMPLITUDE MODULATION AM
- If the message signal m(t) controls frequency gives FREQUENCY MODULATION FM
- If the message signal m(t) controls phase-gives PHASE MODULATION PM or  $\phi M$

- Considering now a digital message d(t):

  If the message d(t) controls amplitude gives **AMPLITUDE SHIFT KEYING ASK**.

  As a special case it also gives a form of Phase Shift Keying (PSK) called **PHASE REVERSAL KEYING PRK**.
- If the message d(t) controls frequency gives **FREQUENCY SHIFT KEYING FSK.**
- If the message d(t) controls phase gives **PHASE SHIFT KEYING PSK**.
- In this discussion, d(t) is a binary or 2 level signal representing 1's and 0's

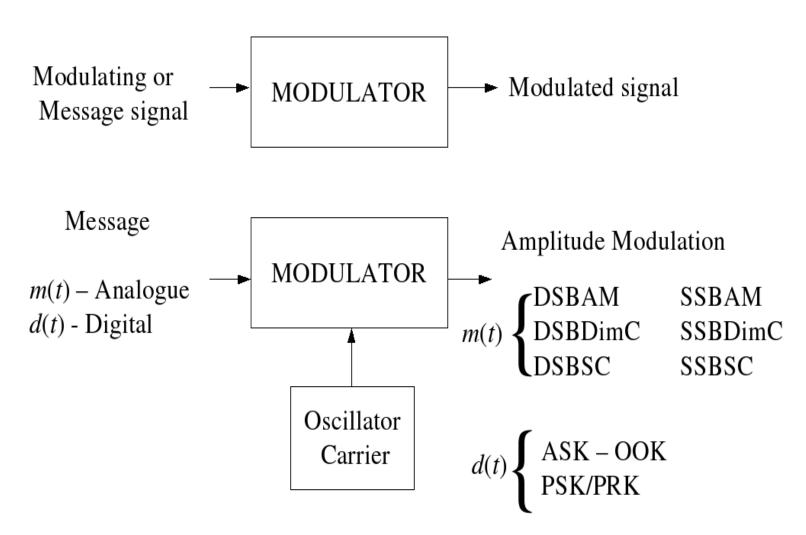

- The types of modulation produced, *i.e.* ASK, FSK and PSK are sometimes described as binary or 2 level, *e.g.* Binary FSK, BFSK, BPSK, *etc.* or 2 level FSK, 2FSK, 2PSK *etc.*
- Thus there are 3 main types of Digital Modulation: ASK, FSK, PSK.

## What is Demodulation?

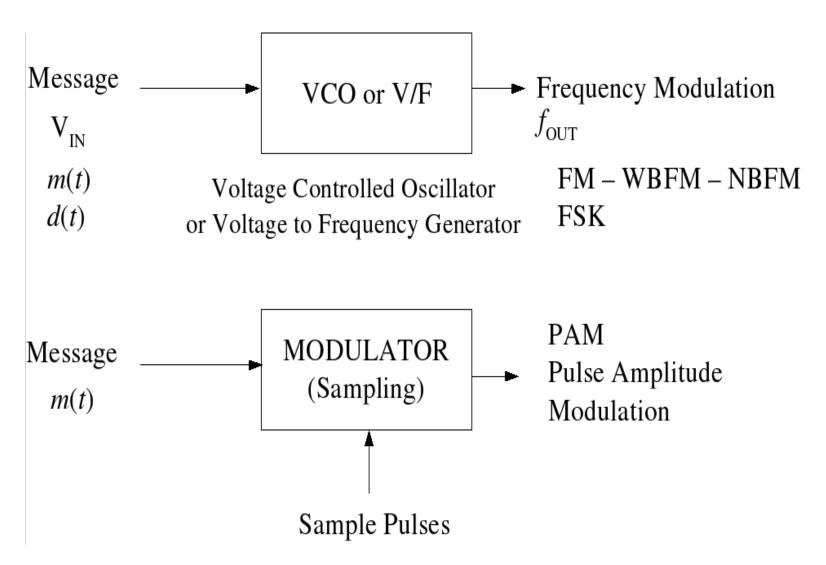

Demodulation is the reverse process (to modulation) to recover the message signal m(t) or d(t) at the receiver.
