Binary Tree Traversal Methods
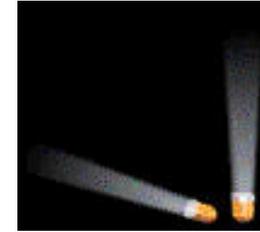

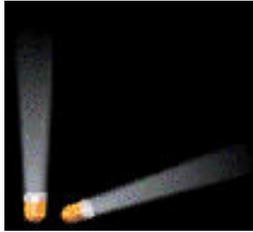

- In a traversal of a binary tree, each element of the binary tree is visited exactly once.

- During the visit of an element, all action (make a clone, display, evaluate the operator, etc.) with respect to this element is taken.
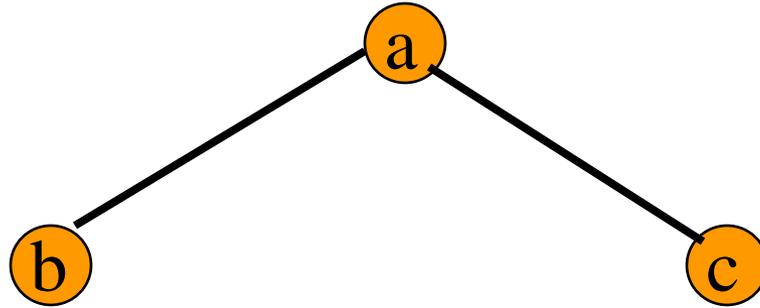

Binary Tree Traversal Methods

- Preorder

- Inorder

- Postorder

- Level order
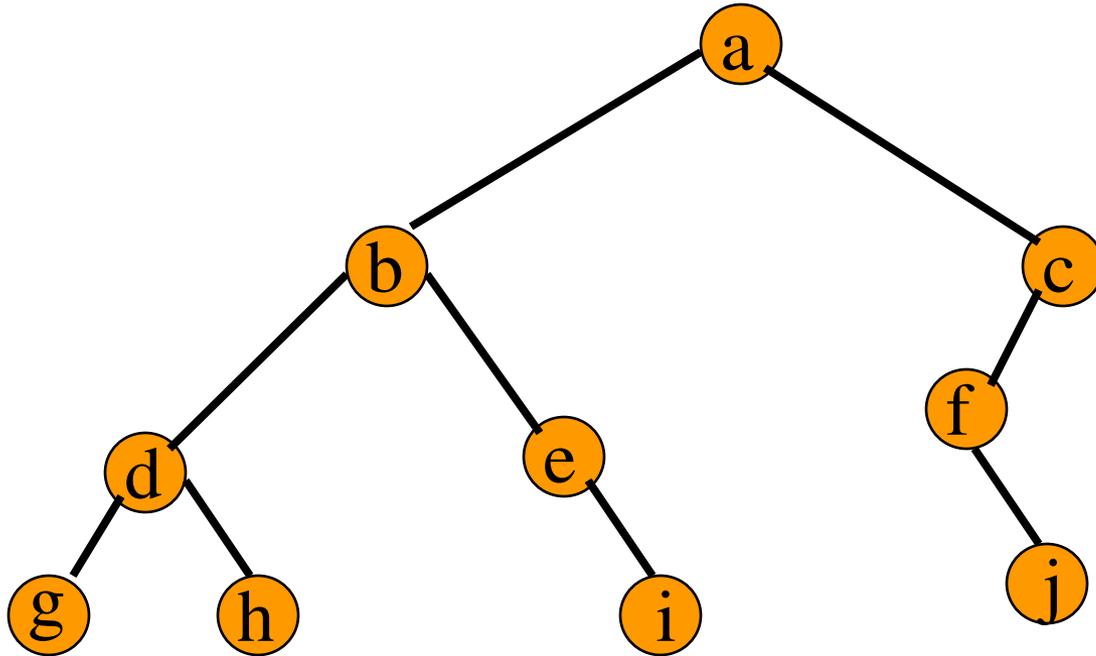

Preorder Traversal

```
void preOrder(treePointer ptr)
{
    if (ptr != NULL)
    {
        visit(t);
        preOrder(ptr->leftChild);
        preOrder(ptr->rightChild);
    }
}
```
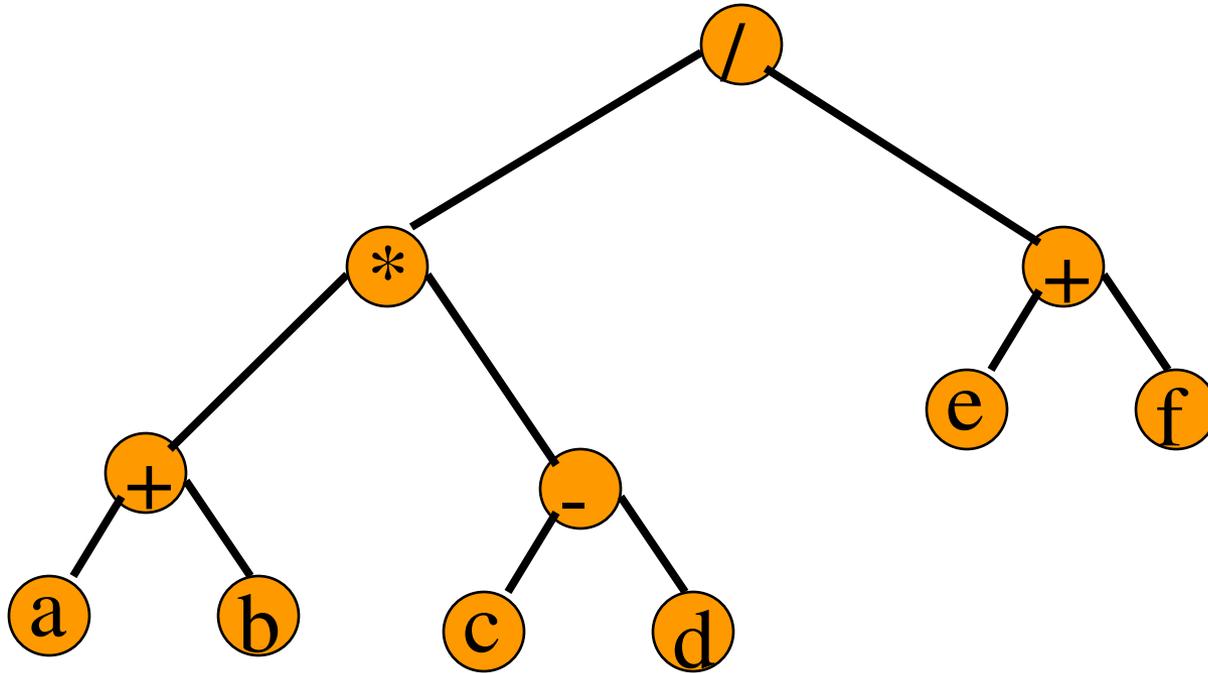

Preorder Example (Visit = print)

a b c

Preorder Example (Visit = print)

a b d g h e i c f j
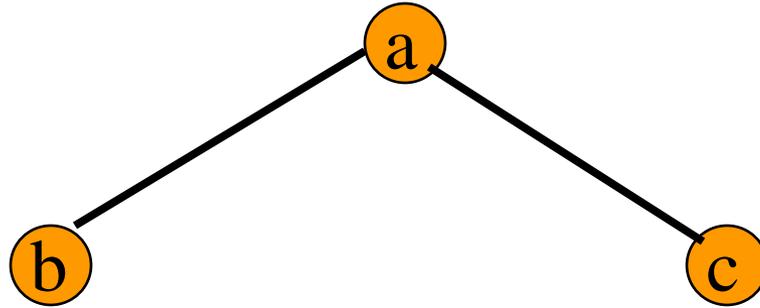

Preorder Of Expression Tree

/ * + a b - c d + e f

Gives prefix form of expression!

Inorder Traversal

```c
void inOrder(treePointer ptr)
{
    if (ptr != NULL)
    {
        inOrder(ptr->leftChild);
        visit(ptr);
        inOrder(ptr->rightChild);
    }
}
```
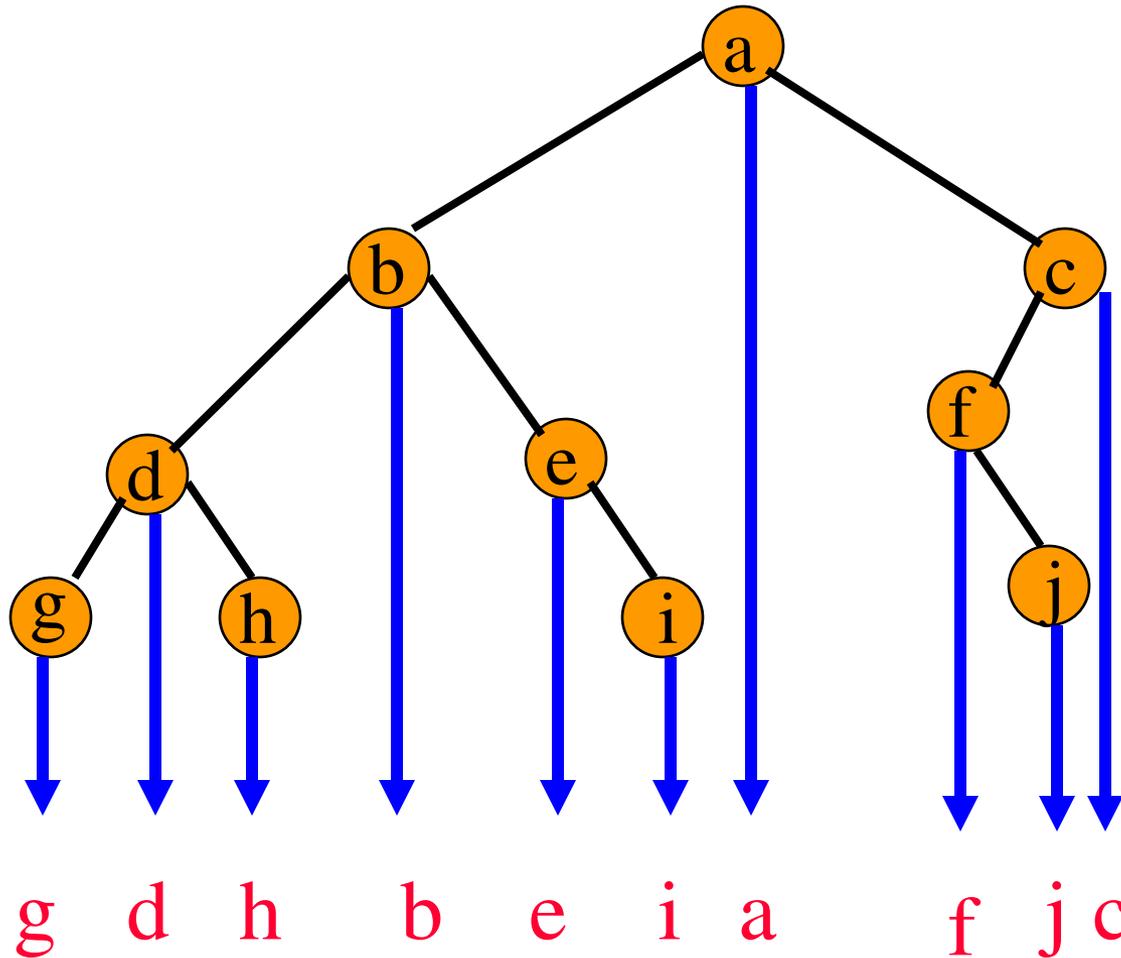

# Inorder Example (Visit = print)

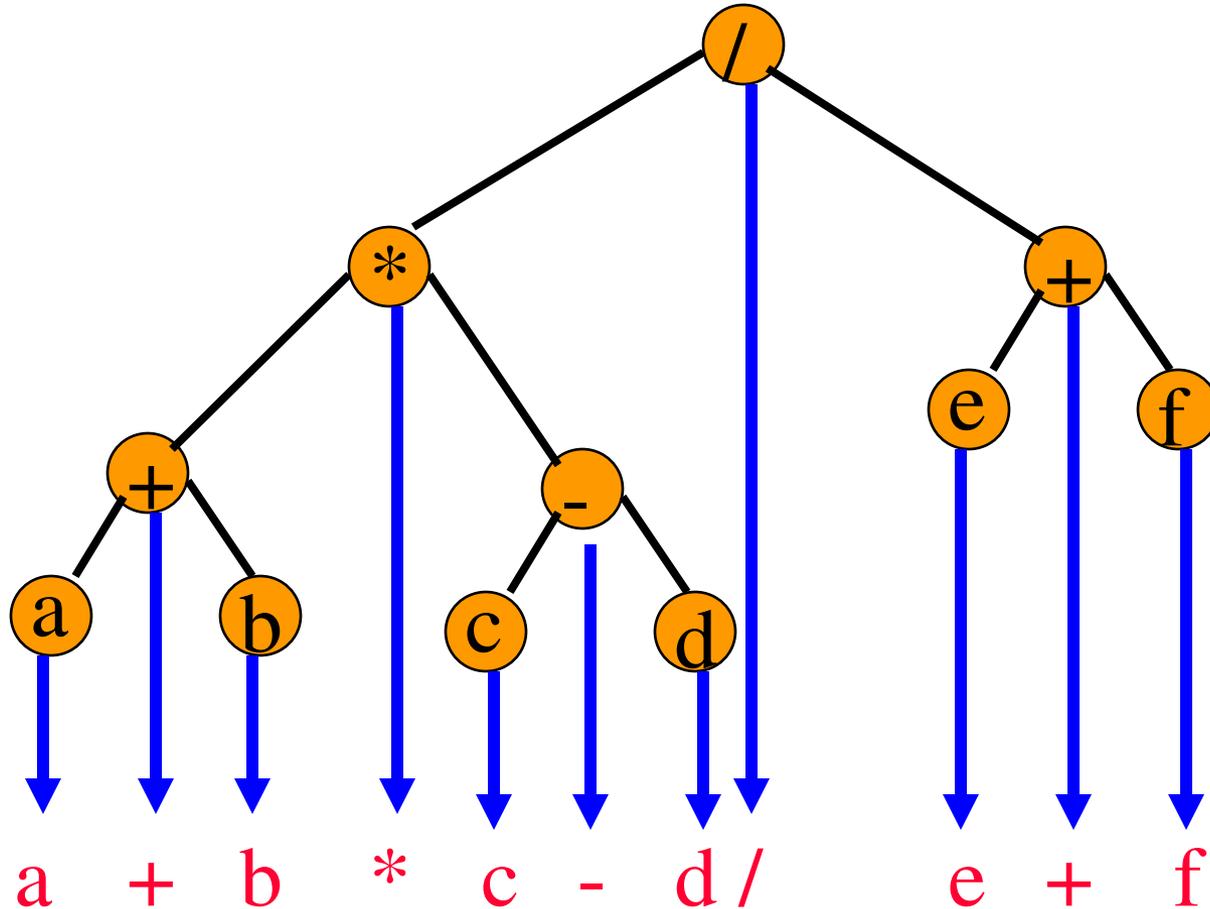

b a c

# Inorder Example (Visit = print)

g d h b e i a f j c

# Inorder By Projection (Squishing)

# Inorder Of Expression Tree

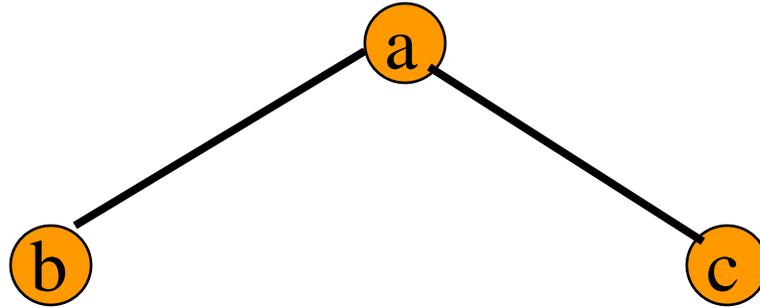

a + b * c - d / e + f

Gives infix form of expression (sans parentheses)!

# Postorder Traversal
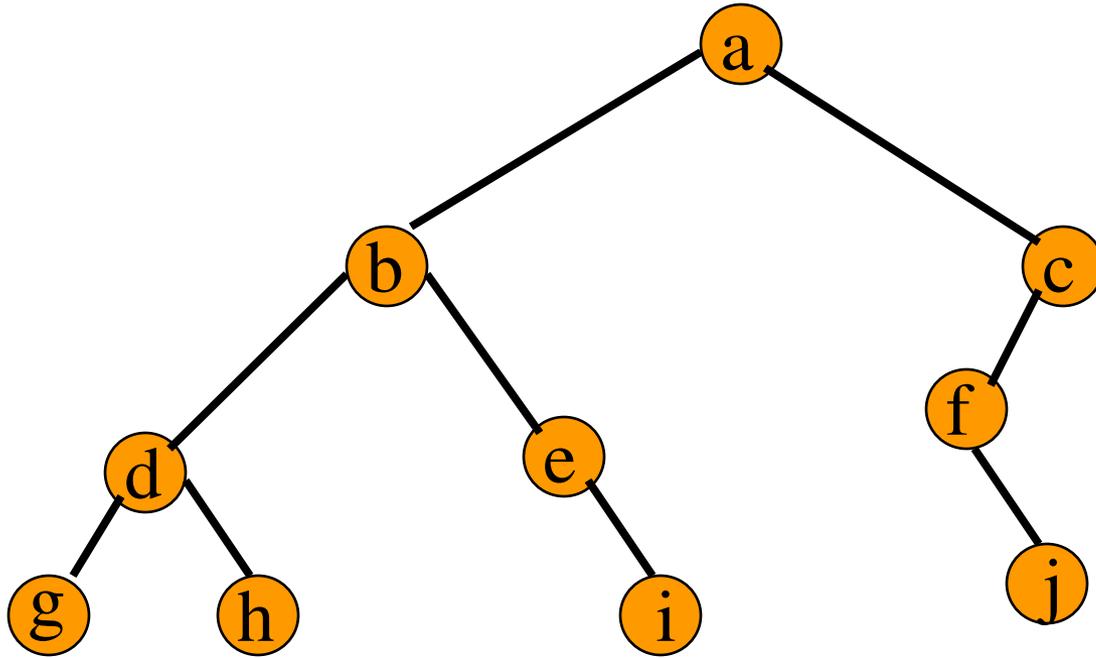

```
void postOrder(treePointer ptr)
{
    if (ptr != NULL)
    {
        postOrder(ptr->leftChild);
        postOrder(ptr->rightChild);
        visit(t);
    }
}
```
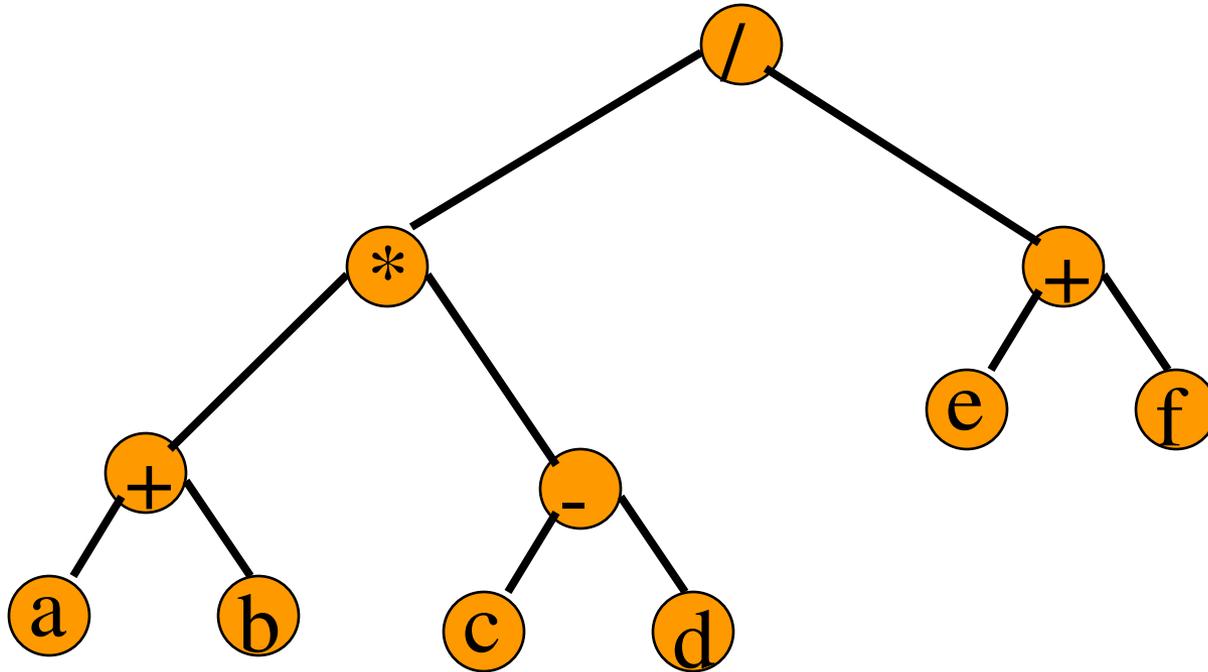

# Postorder Example (Visit = print)

b c a

# Postorder Example (Visit = print)

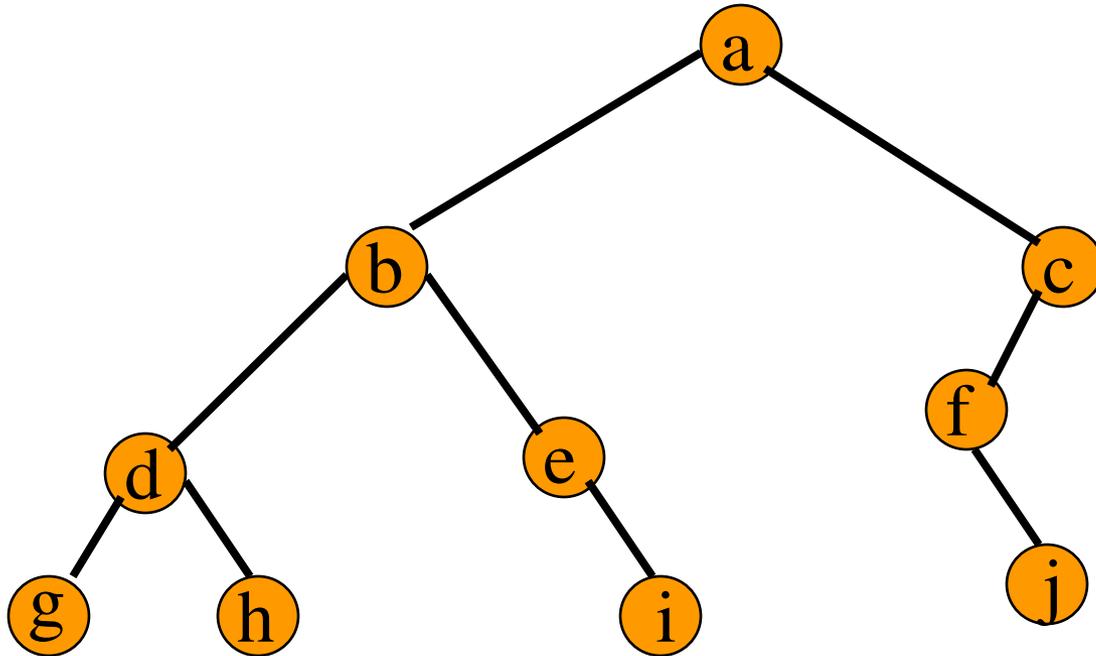

g h d i e b j f c a

# Postorder Of Expression Tree

a b + c d - * e f + /

Gives postfix form of expression!

# Traversal Applications

- Make a clone.

- Determine height.

- Determine number of nodes.

# Level Order

Let ptr be a pointer to the tree root.

while (ptr != NULL)
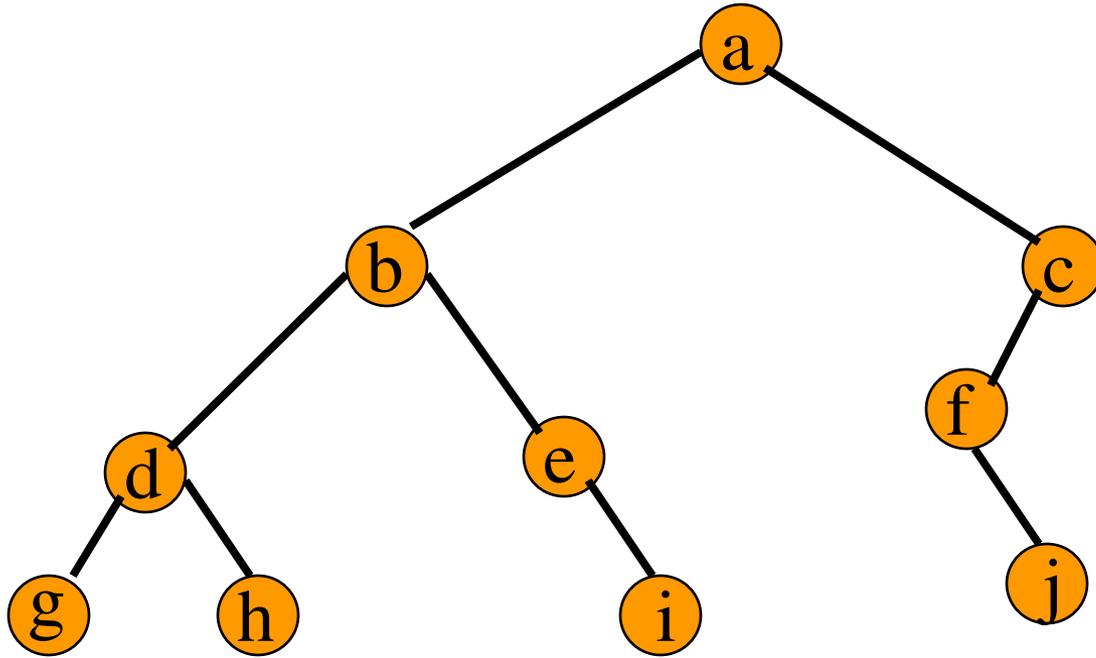

{

    visit node pointed at by ptr  and put its children on a FIFO queue;

    if FIFO queue is empty, set ptr = NULL;

    otherwise, delete a node from the FIFO queue and call it ptr;

}

# Level-Order Example (Visit = print)

a b c d e f g h i j

# Binary Tree Construction

- Suppose that the elements in a binary tree are distinct.

- Can you construct the binary tree from which a given traversal sequence came?

- When a traversal sequence has more than one element, the binary tree is not uniquely defined.

- Therefore, the tree from which the sequence was obtained cannot be reconstructed uniquely.
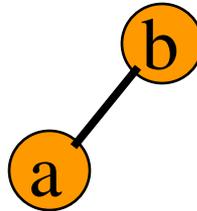

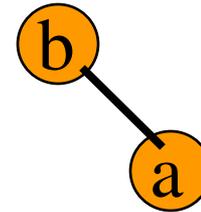

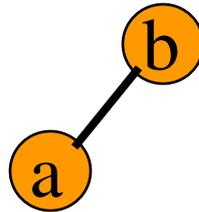

# Some Examples

preorder
  = ab
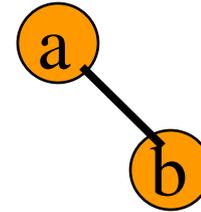

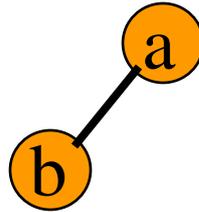

inorder
  = ab
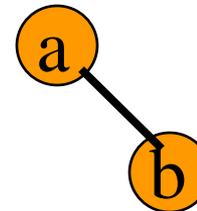

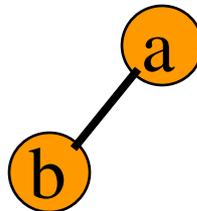

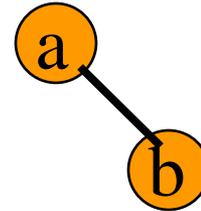

postorder
  = ab

level order
  = ab

# Binary Tree Construction

- Can you construct the binary tree, given two traversal sequences?
- Depends on which two sequences are given.

# Preorder And Postorder

preorder = ab
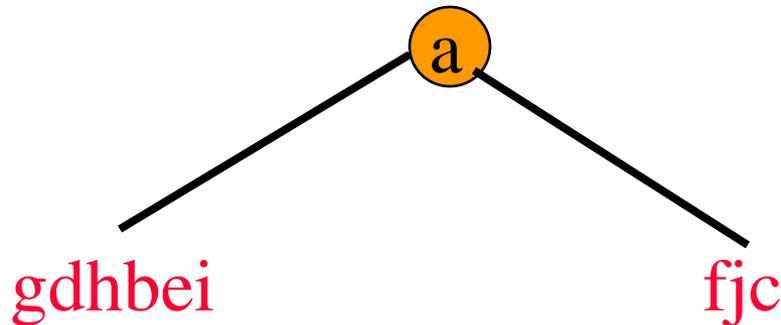

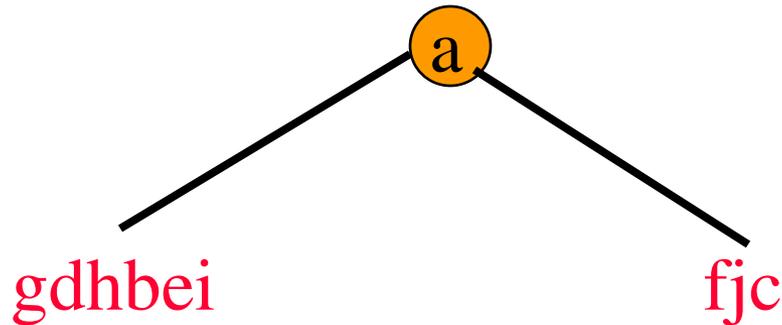

postorder = ba

- Preorder and postorder do not uniquely define a binary tree.

- Nor do preorder and level order (same example).

- Nor do postorder and level order (same example).

# Inorder And Preorder

- inorder = g d h b e i a f j c

- preorder = a b d g h e i c f j

- Scan the preorder left to right using the inorder to separate left and right subtrees.

- a is the root of the tree; gdhbei are in the left subtree; fjc are in the right subtree.
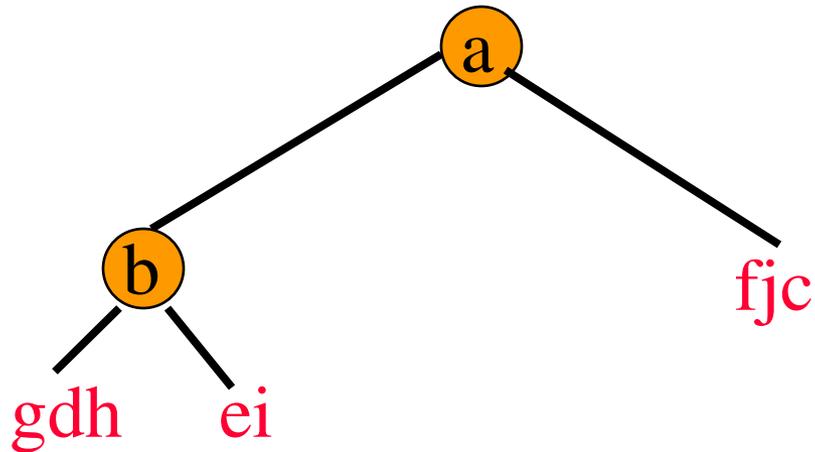

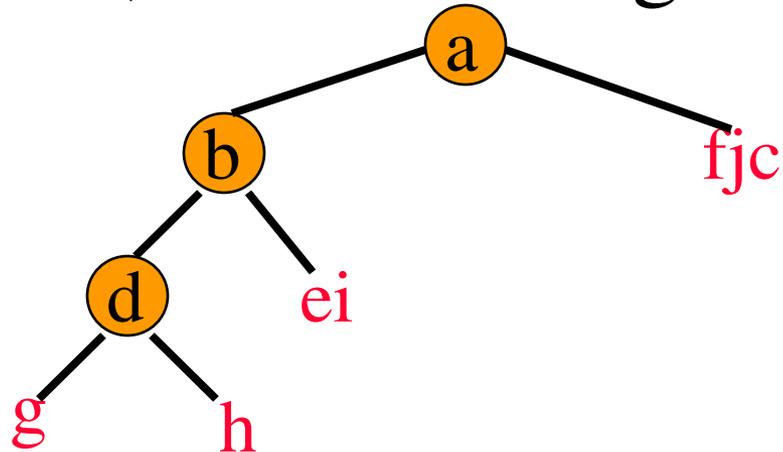

# Inorder And Preorder

- preorder = a b d g h e i c f j
- b is the next root; gdh are in the left subtree; ei are in the right subtree.

# Inorder And Preorder

- preorder = a b d g h e i c f j
- d is the next root; g is in the left subtree; h is in the right subtree.

# Inorder And Postorder

- Scan postorder from right to left using inorder to separate left and right subtrees.

- inorder = g d h b e i a f j c

- postorder = g h d i e b j f c a

- Tree root is a; gdhbei are in left subtree; fjc are in right subtree.

# Inorder And Level Order

- Scan level order from left to right using inorder to separate left and right subtrees.

- inorder = g d h b e i a f j c

- level order = a b c d e f g h i j

- Tree root is a; gdhbei are in left subtree; fjc are in right subtree.
